

TRI-2110

STARTING MANUAL

**MAINTENANCE
DOSAGE
SPARE PARTS**

SOLÀ seed drills and fertilizer spreaders are manufactured in a highly specialized environment and our factory has a vast customer-endorsed experience.

SOLÀ machines use highly advanced technology and are guaranteed to work without malfunctions in a great variety of conditions. They are provided with easy-to-use and efficient devices. SOLÀ machines perform excellently with only minimum operator maintenance.

This manual will help you use your SOLÀ product with the upmost efficiency.

1^a Edition - March 2012

1- INTRODUCTION

It is essential to read and follow the instructions and recommendations in this manual before operating the machine. Careful reading enables maximum operator efficiency, prevents accidents and damage, and increases the seed drill's capacity and life expectancy.

Please ensure that this manual has been read by any person involved in performing operational tasks, (including preparation, dealing with mechanical problems and supervising the machine), maintenance (inspection and technical assistance) and transport.

For your safety, please follow these technical safety instructions as SOLÀ will not be responsible for damages caused by not observing the information provided.

In the first chapters you will find the Technical Characteristics and Safety Instructions, as well as some essential sowing concepts. Basic concepts that are required to operate the machine are explained in the Starting and Maintenance sections. The last part of this manual consists of Dosage Tables, detailed by seed type.

SOLÀ retains the right to modify illustrations, technical data and weights indicated in this operating manual, if these changes help to improve the quality of the seed drills.

2- SAFETY INSTRUCTIONS

2.1- SAFETY SYMBOLS

In this operating manual you will find three different symbols relating to safety:

TO WORK MORE EASILY WITH THE SEED DRILL.

TO PREVENT DAMAGE TO THE SEED DRILL AND OPTIONAL EQUIPMENT

TO PREVENT PHYSICAL INJURY

On the machine you will find the following warning pictograms:

Read the instructions carefully and observe the safety advice given in the operating manual.

During the coupling manoeuvre, stay away from the rear part of the tractor. Risk of serious physical injury.

While maintaining or repairing the seed drill, stop the tractor's engine and prevent it from starting. The ignition key must be removed.

Risk of being crushed when working under the machine, please secure the machine to prevent this risk.

It is forbidden to ride on the machine during operation. Risk of serious physical injuries.

Danger of infection from escaping hydraulic fluid at high pressure! This can inflict serious injuries with potentially fatal consequences if it passes through the skin and into the body. Keep the hose lines in good condition. Risk of serious physical injuries.

Be careful when closing the hopper's lid. Keep your hands away from hopper's edge to prevent them being caught.

Never stand under the sowing equipment, or swivel area of the machine's extension tine coulters. Risk of serious physical injury.

Do not exceed maximum load.

Loading and unloading coupling point.

Do not insert your hand into the hopper while the drive wheel is turning. Risk of serious physical injury

2.2- USE ACCORDING TO DESIGN

-The Seed Drill TRI-2110 has been designed for normal use in agricultural work, especially cereal and other kind of grain seeds.

-If the machine is used in circumstances other than the above, the manufacturer will not be held responsible for any damage caused.

-The user must observe all regulations concerning safety, traffic and hygiene.

-If the machine is modified by the user, the manufacturer's warranty is cancelled. SOLÁ will not be held responsible for any damage caused.

2.3- GENERAL SAFETY INSTRUCTIONS

- Before starting the machine, please check the machine is in good condition for work and is safe for road use. Check that visibility is clear around the machine and there is no person in the working area.

-In thoroughfare, please observe traffic signs and regulations.

-It is forbidden to ride on the machine or climb into the machine when it is running.

-Before using the machine, the user must be familiar with all operating elements.

- Please be extremely careful when coupling and uncoupling the machine to the tractor.

- While performing dosing tests, be careful with possible dangers caused by turning pieces. Pay special attention to the agitator's tines from inside the hopper, as well as the wheel drive's scraper.

- Fast-locking hooks must stay unlocked. They should always remain closed and should only be opened when the machine is on the ground to be uncoupled.

- Never leave the tractor's driver's seat while the machine is in operation.

-Do not deposit external elements inside the hopper.

-Before any work in the hydraulic system of the seed drill, lower the machine and make sure that the system is depressurised and the tractor's engine is off.

-Please regularly check the condition of the tubes and hosepipes in the hydraulic system. These parts age naturally and their life should not surpass six years. Please replace when necessary.

-When raising the seed drill, the front axle is unloaded. Ensure that the machine has enough load to prevent it overturning. At this time you must ensure that the condition of both the steering and the brakes is optimal.

- During transit with the raised seed drill, block the lowering switch. Before leaving the tractor, lower the seed drill onto the ground and remove the tractor's starting key.

- Always use enough supporting elements when maintaining the machine in a raised position to prevent the machine from lowering or falling.

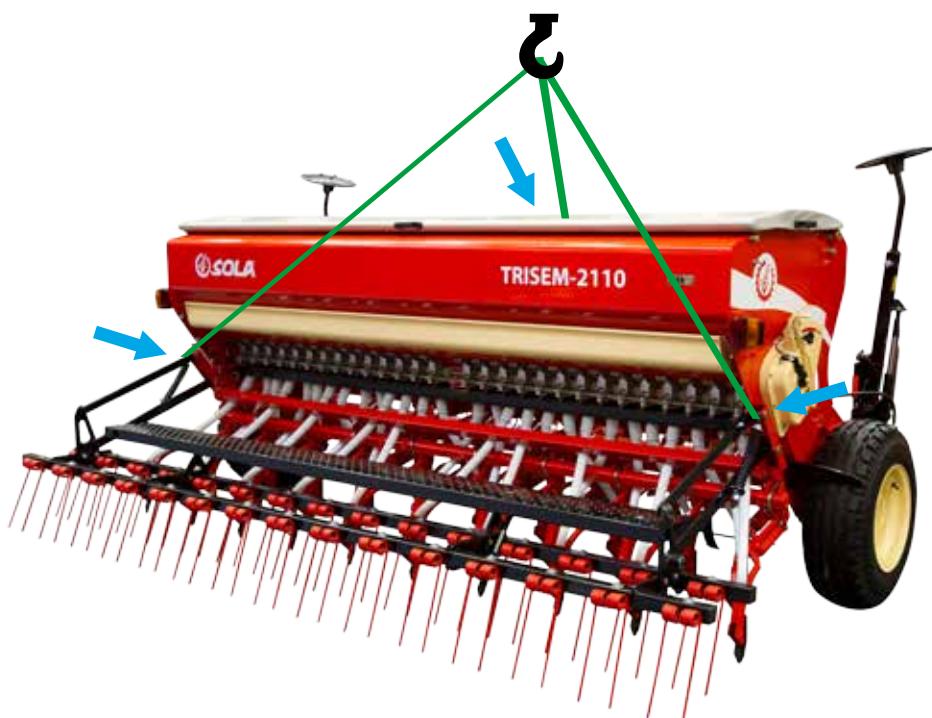

2.4- LOADING AND UNLOADING INSTRUCTIONS

Figures 1 and 2 show how and where to place the tow ropes to perform this operation: in the machine's three-point linkage as well as in the fasten points situated in the harrow's support.

These are dangerous tasks. They should only be performed by qualified and experienced personnel.

When the seed drill is suspended, be sure that the danger zone below and surrounding the machine is clear to prevent serious consequences in case it falls.

3- ESSENTIAL SOWING CONCEPTS

3.1- TERRAIN

The better the soil condition, the better the sowing quality. Work is more difficult on big clods or uneven furrows. Although SOLA machines resist harsh conditions, if the seedbed does not satisfy appropriate conditions then the sowing quality will suffer.

3.2- THE SEED

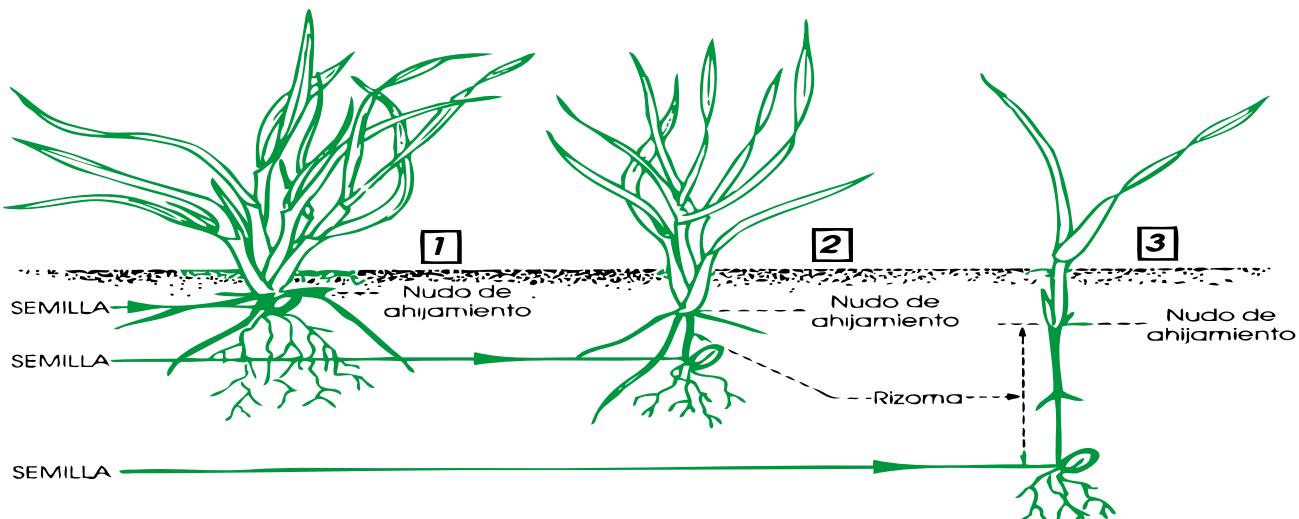

It is essential that seeds are well maintained and clean. Barley seeds should be trimmed.

3.3- SEED PLANTING DEPTH

The recommended seed planting depths are from three to five centimetres. Planting too deep causes problems as rhizome cannot reach the surface and the plant will die. It does not matter that some grains are visible because the harrow's tines will cover them eventually.

The seed planting depth has consequences for tillering, as well as for the plant's strength and its ability to resist frostbite or drought. The parent shoot grows from 1 to 2 cm under the ground, whatever the depth of the seed.

Planting deeper does not necessarily mean getting deeper roots. Only a few roots grow from the lower part of the seed. Most of them grow from a parent shoot close to ground level.

Normal Planting Depth: from 2 to 4 cm

Thick stem, short rhizome, resistant to frostbite

Multiple tillering providing from 3 to 6 shoots and a lot of blades, from 6 to 10.

Deep and thick roots, approximately 5 cm in width and 10-12 cm in depth.

With less grains per sowing square metre, more ears are obtained.

Deeper Planting: from 5 to 6 cm

Fine stem, rhizome exposed to frostbite.

Late and weak tillering, 1 or zero shoots and only a few blades, 3-4 approx.

Medium quality roots of approximately 3 cm in width and 5 cm in depth

More grains per sowing square metre are required to obtain the same number of ears as in the previous case.

Very deep planting: from 8 to 10 cm

Very fine stem. No tillering and only one blade.

Seed runs out of supplies by growing a long rhizome which frostbite can easily cut.

The plant takes weak roots, approximately 1 cm in width and 3 cm in depth.

Twice the number of grains per sowing metre are required to obtain the same number of ears as in the first case.

In very cold places, repeated frostbite can have a honeycomb effect on the ground's most superficial layer. In this case the plant's very first roots can loosen and the plant will die. Slightly deeper planting is recommended and if possible, the use of rollers to compact the earth to better protect the seeds.

In all SOLÀ machines, the right side wheel activates the seed distributor's mechanical transmission. Consequently, sharp curves should be performed towards the left side, since using the ground wheel drive would cause a lesser seed distribution.

When starting the machine, furrows will not contain any seeds for a metre. When stopping the machine, seeds which were previously inside the seed hoses, slide from the machine and end up piled on the ground. Take this into account when stopping and starting the machine in order to achieve more accuracy.

Always work at a uniform speed as sudden accelerating and slowing down will cause an irregular seed distribution.

3.4- SEED DOSING ADJUSTMENTS

When using high quality certified seeds it is not enough to know the weight in kilograms distributed by the machine, as the final result of the harvest will depend on the number of plants which eventually ripen.

Every plant requires a certain amount of land from which nutrients will be absorbed. Therefore, both a low or an excessive plant density can be detrimental. To determine how many kilograms per hectare are to be sown, you should know the number of plants per square metre that are going to be planted.

As a guidance, the recommended number of plants per square metre when sowing wheat or barley in un-irrigated land can be found in following table:

AUTUM:	Premature sowing, 200 plants per m ² Late sowing: 265 plants per m ²
---------------	---

SPRING:	Premature sowing, 310 plants per m ² Late sowing: 445 plants per m ²
----------------	---

Please note that in spring there is less tillering so more seeds should be sown

MAQUINARIA AGRÍCOLA SOLÁ, S.L. RECOMMENDS THAT THE FARMER SEEKS PROFESSIONAL ADVICE ABOUT THIS SUBJECT FROM A TECHNICAL SOWING CENTRE.

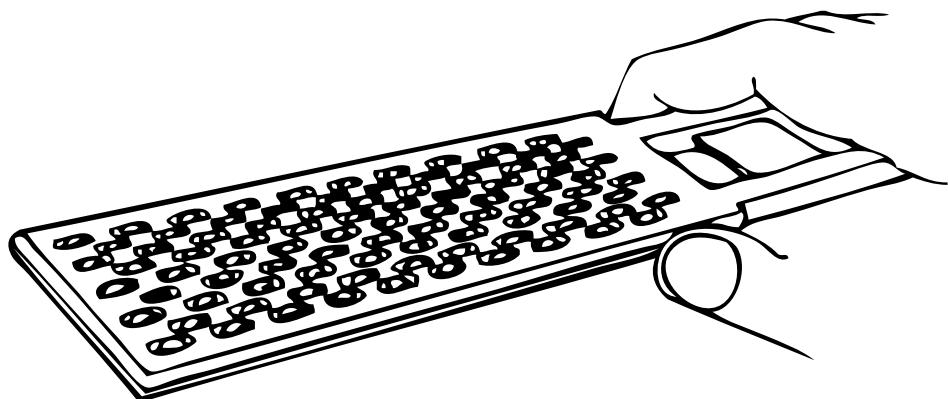

SEED DOSING SHOULD BE ADJUSTED TO EACH TERRAIN, DEPENDING ON THE: TEXTURE, FERTILIZING LEVEL, PLUVIOMETER RESULTS AND SOWING SEASON, GRAIN QUALITY, GERMINATING AND TILLERING POWER, ETC

It should be taken into account that a seed's germinating power is variable and dependant on multiple factors. It can be experimentally calculated to be between 70% and 80%, which is practically equivalent to multiplying the number of grains to be sown by 1,43 or 1,25 respectively.

Next, we describe a practical method to determine the number of kilos per hectare to be distributed once we know how many plants per square metre we want to obtain.

1) Place seeds on the "seed counter"

Wipe seed counter with your hand to make sure that there is only one grain per slot (100 grains in total). Do the same 10 more times to obtain 1000 grains

2) Weigh 1000 grains with the precision scales. We call the result the OPERATIVE WEIGHT.

3) Once we know how many seeds per square metre we are going to sow, we should adjust the following kilograms per hectare in the dosing control:

$$\text{kilograms per hectare} = (\text{grains per m}^2 \times \text{OPERATIVE WEIGHT}) / 100$$

4-STARTING

4.1- COUPLING

Seed drill TRI-2110 is fitted for fast coupling to the hydraulic lift. The oscillating coupling bar adapts to ground's irregularities. In order to switch it off, place the machine in a raised position and unlock the two locking hooks (1, fig 5) to secure the hooked clip (2, fig 5) of the lever's (3, fig 5) to the axis (4, fig 5).

All machines are supplied with a supporting base to secure the machine during transportation and prevent accidents. It must be removed before working with the machine.

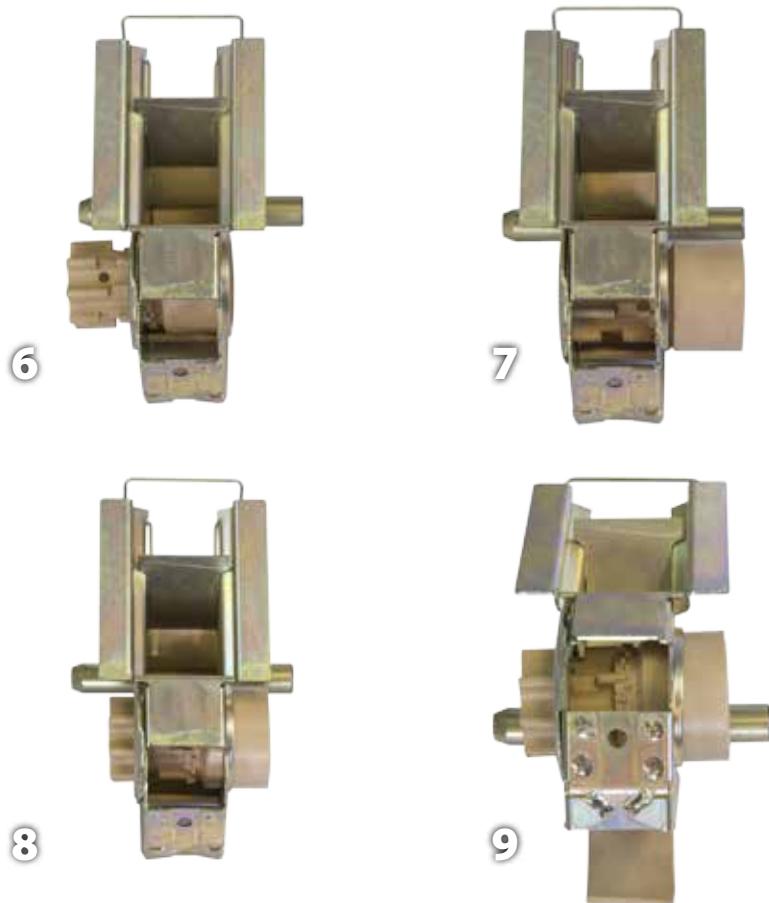

Make sure that nobody is ever between the seed drill and the tractor when coupling both machines.

4.2- DOSING SYSTEM

SOLA's dosing system can be adjusted to the following working positions:

- Narrow position with small housings, used for small seeds (fig. 6).
- Wide position with large alternated housings, used for regular or big seeds (figs. 7 and 8).

Base flap performs two roles:

- It adjusts its opening to adapt to seed's size. (figs. 6,7 and 8).
- It empties the hopper into the calibration cup (fig. 9).

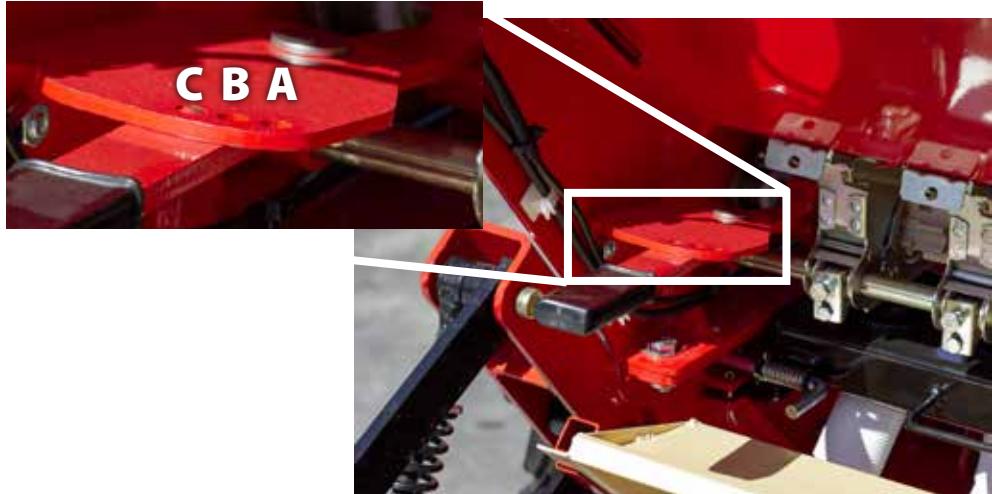

To easily switch from WIDE to NARROW position, seed wheels dosing must be without seeds, otherwise the seeds will difficult seed wheel's turning.

Once the position is chosen (narrow or wide) and the base flap is adjusted (depending on the seed's size), seed flow to be dosed will depend on seed wheel's speed. The gearbox allows to adjust the seed wheel's speed to sow from 0 to 600 kg/ha in a very precise way.

4.3- SEED DOSING

Check that the shutoff gates are open and allow the seed flow. Before filling the hopper, check that there are no external elements inside the hopper and next connect the agitator's shaft to the gearbox's axle.

Move the lever to switch between narrow and wide position in the seed wheel

- A. To the right to set wide position for wheat, barley, etc.
- B. To the centre to set medium position for sunflowers, peas, etc.
- C. To left, to set narrow position for lucerne, rape, etc.

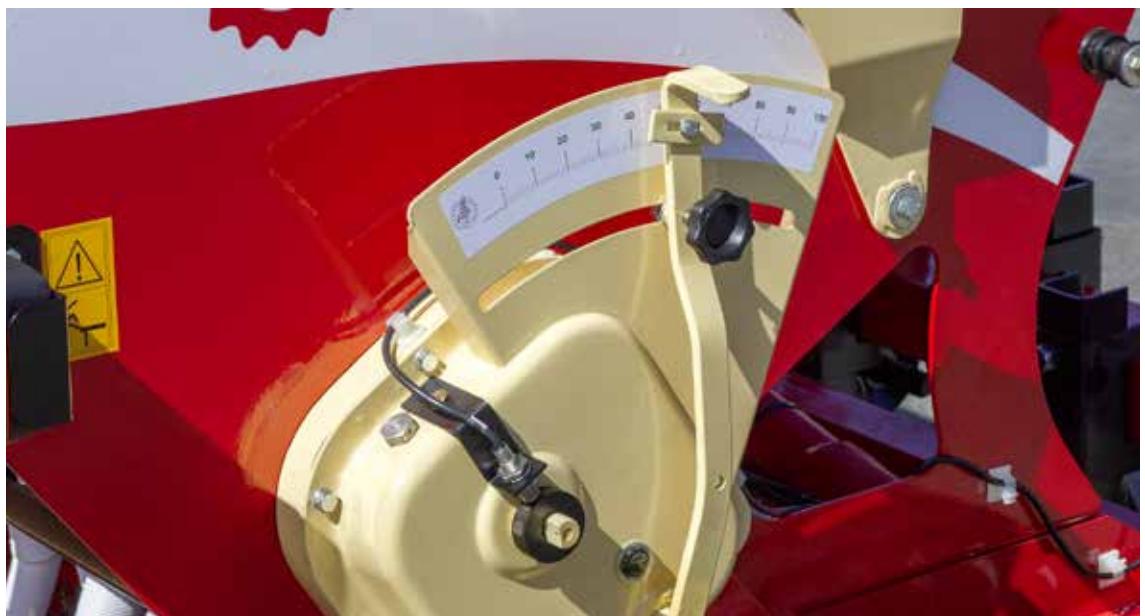

The base flap lever (placed on the left side of the hopper) has 7 positions

- No 1, for small seeds.
- No 3, for wheat and barley.
- No 5, for big seeds.

To empty the hopper, place the calibration cup under the seed wheels and move the lever beyond position n° 7 (emptying position).

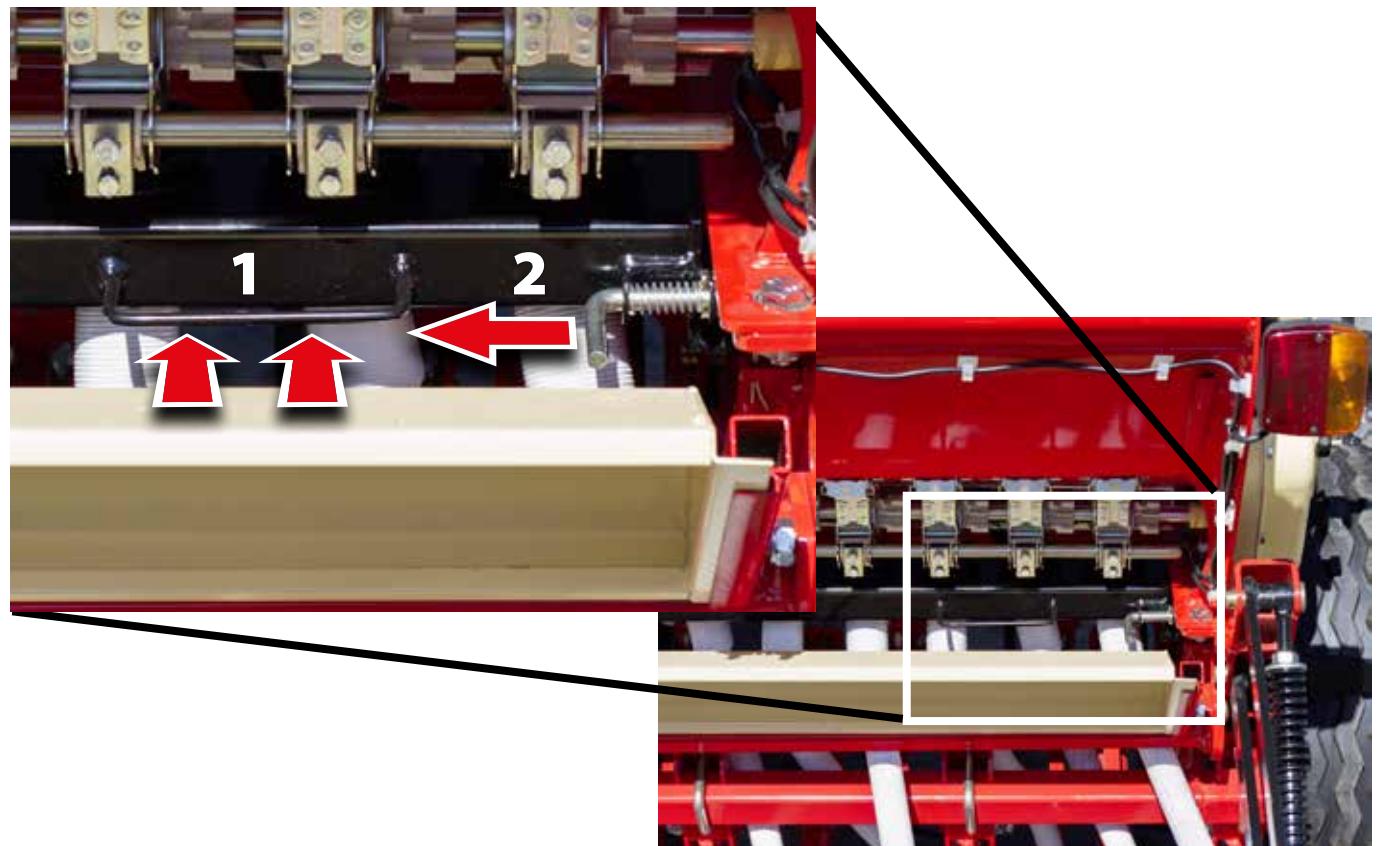

Finally loosen gearbox's knob, move the gear lever on the sector graduated from 0 to 100 and tight the knob in the number position selected previously, as indicated in the dosing tables.

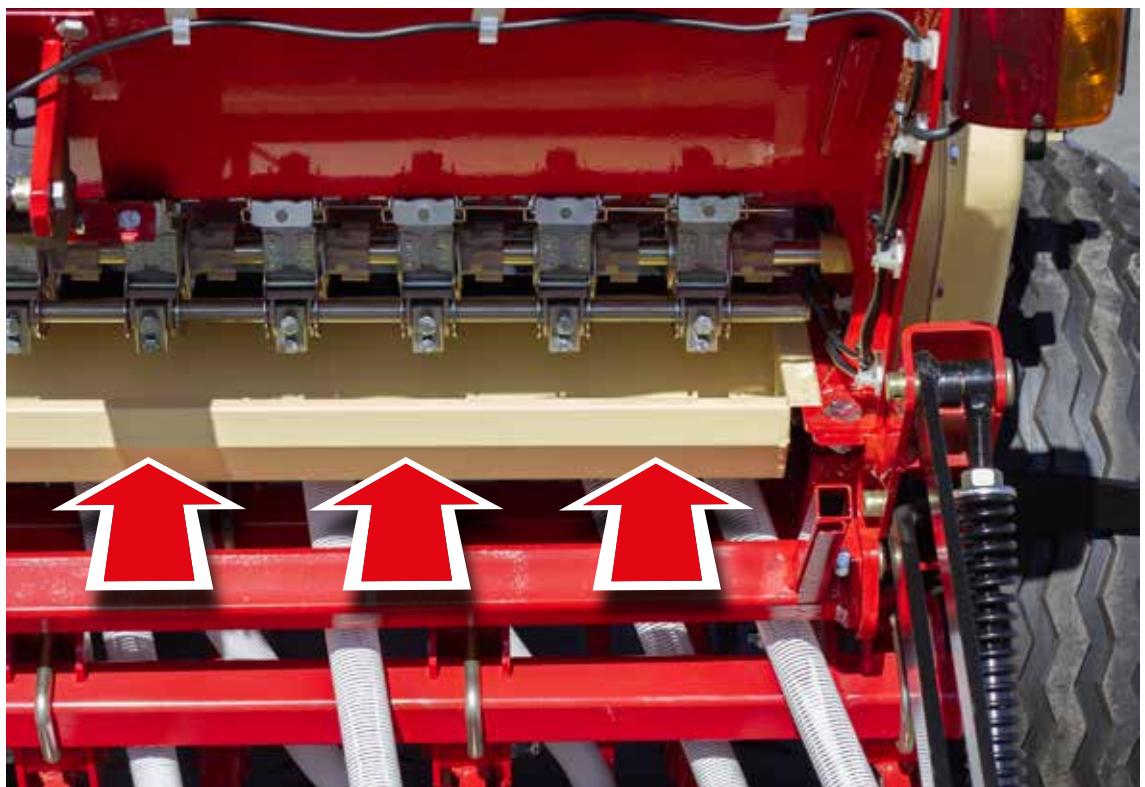

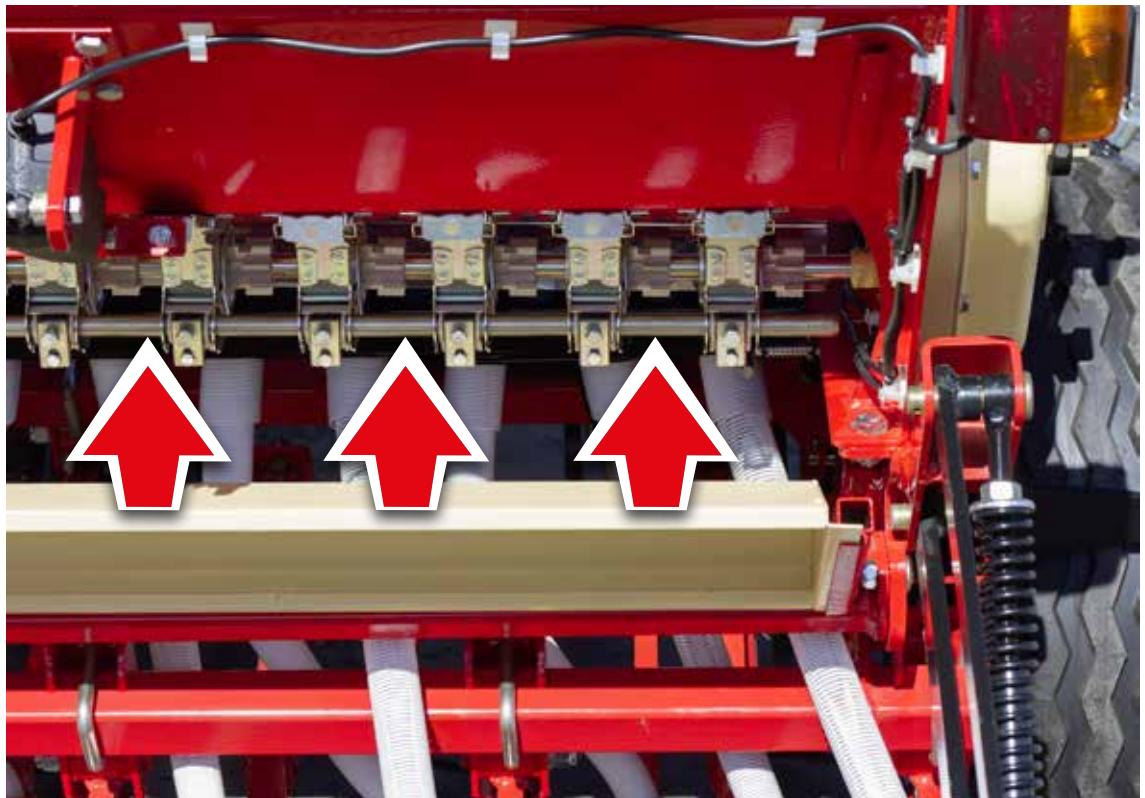

4.4- CALIBRATION TEST

Once the narrow or wide position is selected, and both the base flap and the gear lever are in correct position, it is essential to perform a calibration test.

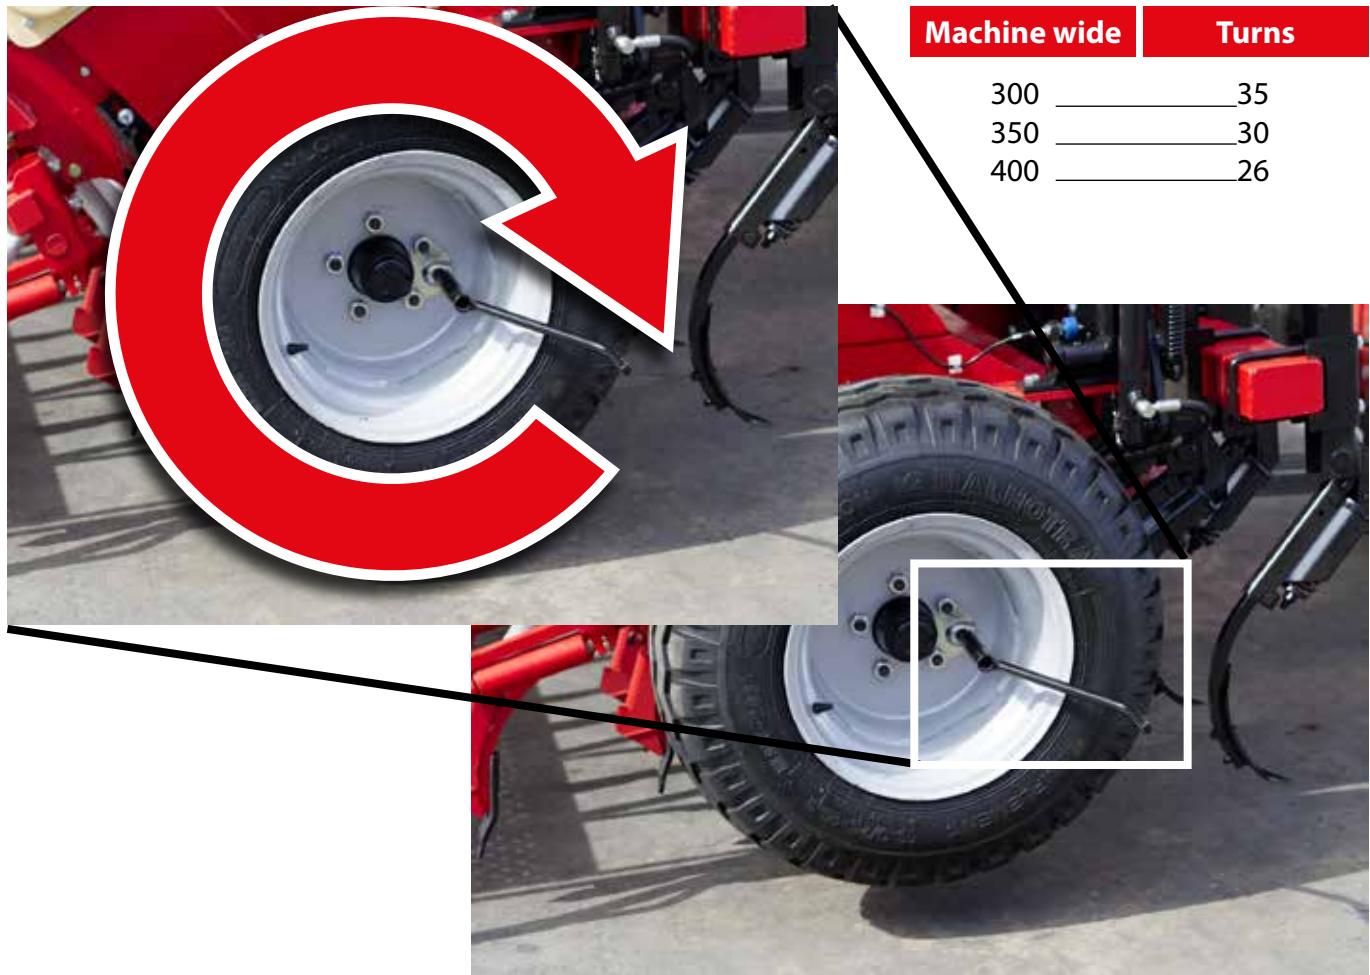

FIRST: withdraw the spring-loaded lever (2,) that keep the hopper bar in working position and push the bar (1) forward until the end. This will allow to place the calibration cup under seed wheels.

SECOND: Pull the calibration cup upwards out of their holders and place it under the seed wheels.

THIRD: Raise the seed drill using the tractor until the wheels can turn free. Place the calibration crank in the bolt on right wheel and turn it clockwise until seeds start to fall onto the calibration cup . At this moment, stop turning, put these seeds back inside the hopper and start turning the crank again to perform the real turns of the test.

You must turn the wheel uniformly using the crank at approximately one revolution per second, depending on the land's characteristics, tyre's manufacturer or tyre pressure. For this reason it is highly recommended to perform a field test as described in this manual (4.5).

At the end, accurately weigh the collected seeds that are in the calibration cup. At a selected opening, you can obtain the kilograms per hectare distributed by the machine, by multiplying the weight by 40.

For ease of performing these operations the machine should be coupled to the tractor in a slightly elevated position (wheels should not be in contact with the ground). It is also necessary that the hopper is only half-filled with seeds to alleviate difficulty in turning the wheel with the crank.

If seeds show excess treatment powder, flow can be reduced, consequently a second control is recommended after sowing approximately three hoppers.

It is dangerous to turn the wheel with your hands as the mud scraper can cause injuries.

4.5- FIELD TEST

If differences exist between the test and the actual dose distribution (due to a very uneven or light soil, low pressurised tyres, etc.), an experimental test can be performed.

First of all, the distance (in metres) as shown in the table below should be marked on the field's ground using a tape measure.

Machine wide	Displacement (m)
300	83,3
350	71,4
400	62,5

Next, the seed drill in working position should cover that distance.

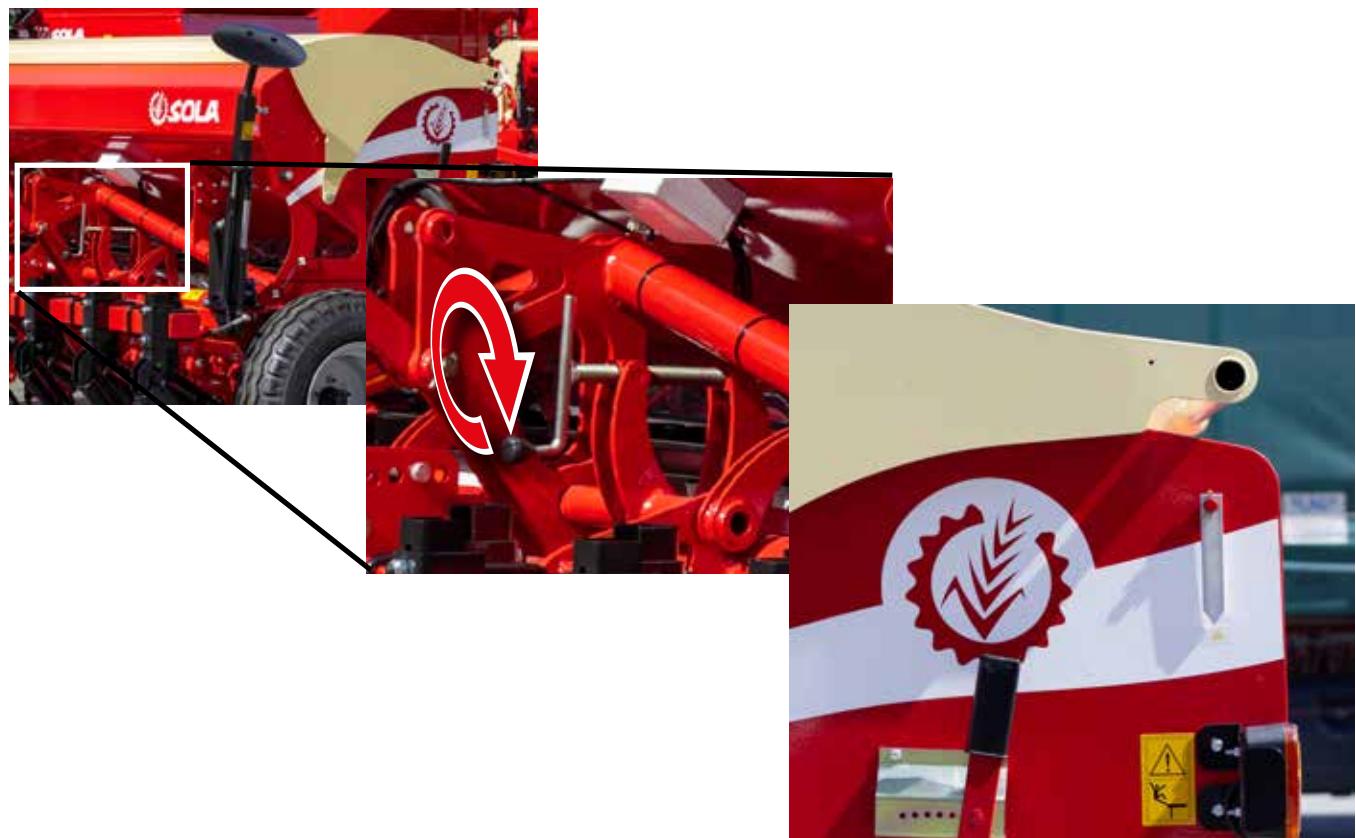

By means of a mark made previously on the tyre, count the number of turns performed in the covered distance. A good place whereby which to count could be the wheel's mud scraper.

By following these steps we can obtain the actual number of turns performed in the seed dosing test. By performing the test, we will know the actual kilograms per hectare distributed by the machine.

4.6- COULTERS DEPTH AND PRESSURE ADJUSTMENT

The coulters depth is set with an central adjuster spindle).

Previously we have explained how to adjust the pressure for each coulter individually

4.7- TINE COULTERS ADJUSTMENT

Tine coulters are secured to their support by means of a special nut (1, fig. 23) equipped with a auto-tightening nut. Tighting this bolt allows to correct the tine coulter's lateral looseness. This operation should be performed periodically.

5- OPTIONAL EQUIPMENT

5.1- TRACK ERASERS

Track erasers are very efective devices to erase tractor's tracks. The four coulter's height and lenght can be adjusted depending on the vehicle's tread.

5.2- PARALLELOGRAMIC-SHAPED HARROW WITH FLEXIBLE TINES.

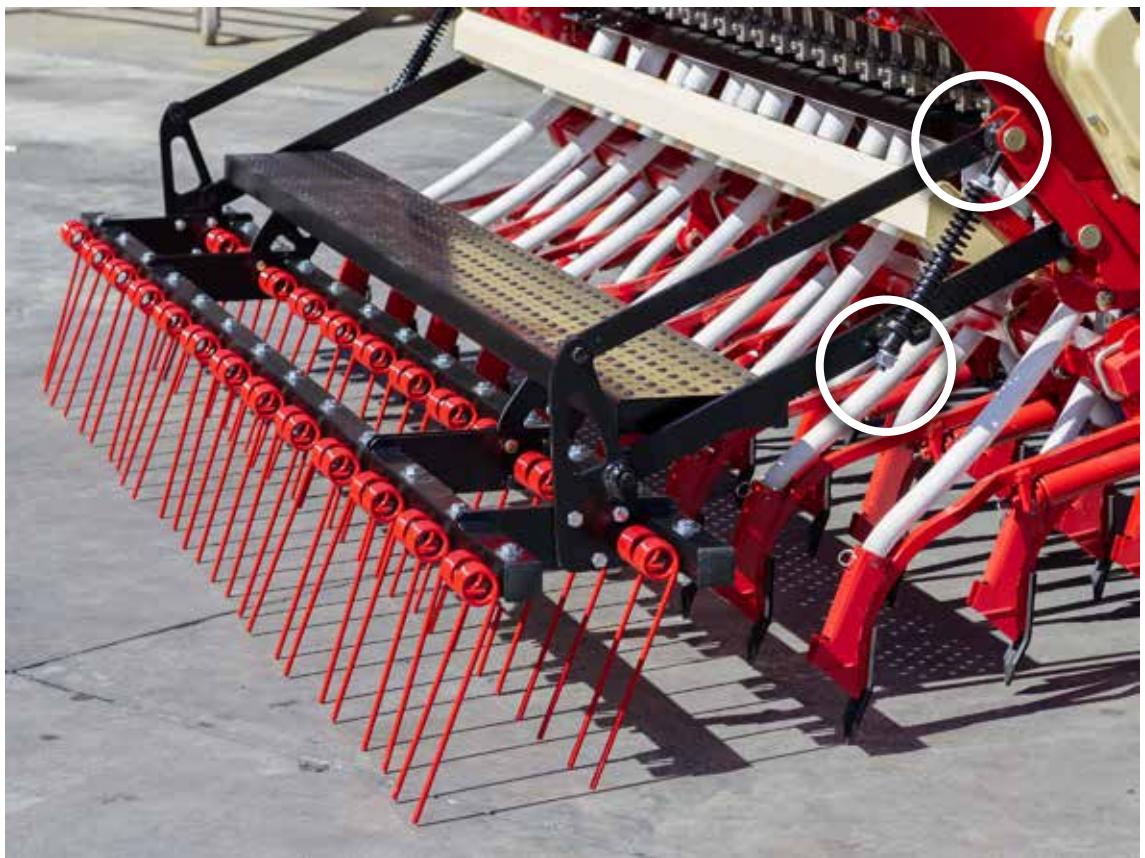

Harrow with double-tine springs which contribute to cover back the furrows produced by the sowing tine coulters.

By using the upper nut, the harrow's working pressure can be adjusted.

To adjust working depth, use the lower nut.

Parallelogramic-shaped joint allows the flexible tines to adapt vertical and horizontally to terrain irregularities in an excellent way.

Use always original double-tine springs SOLÀ, since they have been rigourously tested to achieve the highest quality.

Never step up the harrow when the machine is running.

5.3- TRACK MARKERS

Hydraulic track markers

Track markers should be assembled using the supplied screws in the supports placed in both sides of the machine. They are hydraulic and should be connected to a double-acting connection so that one arm is in vertical position and the other one is in working position. Cylinders contain a throttle to slow down and smooth the track marker's lift. Before starting work, check that they are in working order.

Track discs can be orientated to achieve the correct penetration angle and their supporters are extensible in order to be correctly adjusted. Track markers also have an extra spring which allows to adjust the pressure that track discs perform on the ground.

To calculate the horizontal spacing between track discs and the last lateral tine coulter, use following formula:

$$L = \frac{\text{Working width of the seed drill} + \text{track width of the tractor + row spacing}}{2}$$

PLEASE NOTE: PERFORM THE CALCULATION USING MEASUREMENTS IN CENTIMETRES.

HIGH PRESSURE OIL MAY ESCAPE, PASS THROUGH THE SKIN AND INGRESS INTO THE BODY, CAUSING SERIOUS INJURIES. KEEP HYDRAULIC HOSE LINES IN GOOD CONDITION.

NEVER STAND UNDER THE TRACK DISCS OR WITHIN THEIR OPERATIONAL AREA

In order to transport the machine, it is essential to fold the track markers so they stay in a vertical position and pin them to the transport bracket using a lynch pin. This will prevent them from lowering during transit.

WHEN PULLING THE HYDRAULIC PIPES, BE SURE THAT THEY CAN NOT BE DAMAGED WHEN RAISING OR LOWERING THE SEED DRILL. CHECK ALSO THAT THEY ARE NOT EXPOSED TO ANY FRICTION.

DO NOT ADJUST SPRINGS AT HIGH PRESSURE NOR ORIENTATE TRACK DISCS VERY OBLIQUELY TO PREVENT SERIOUS DAMAGES TO THEM.

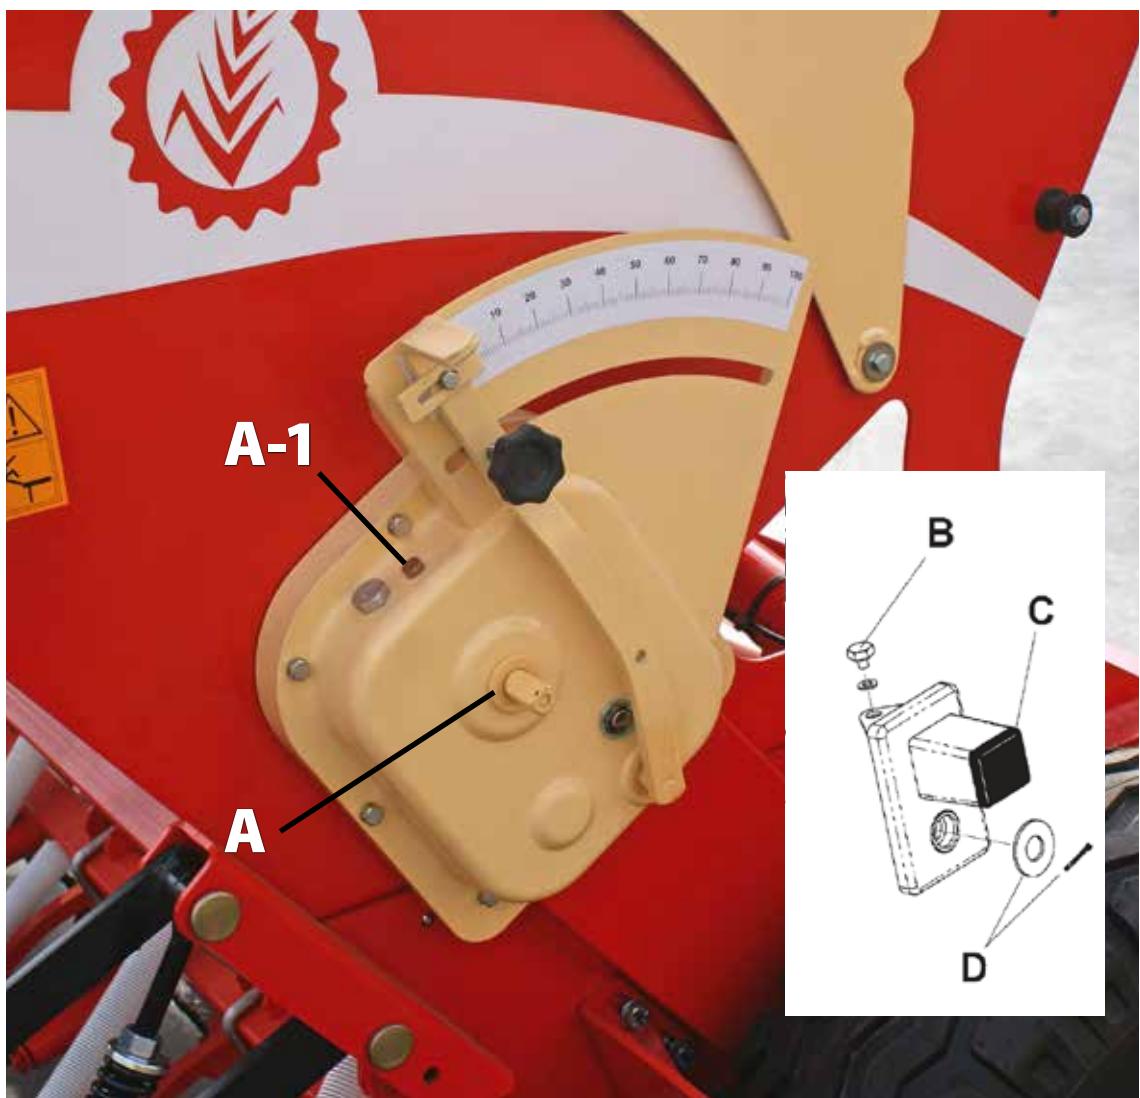

5.4- HECTARE COUNTER

The screw placed in gearbox's upper part must be removed (B1). Next, the hectare counter must be assembled over the gearbox's axle (A) and the special screw (B) supplied with the hectare counter must be screwed down in place A-1.

To access to the hectare counter's reset control, remove the black lid (C, fig. 33).

Finally, a washer and a pin should be placed at the end of the gearbox's axle (D, fig. 33). It is important to check that the pin is not in contact with the hectare counter's box when turning.

Hectare counter "SOLA 90" is a direct reading type (hectares and squared metres) and both pinion gears are specific for each machine type, as indicated in the following table:

If the hectare counter are supplied separately from the machine, it is advisable to check that pinion type is correct.

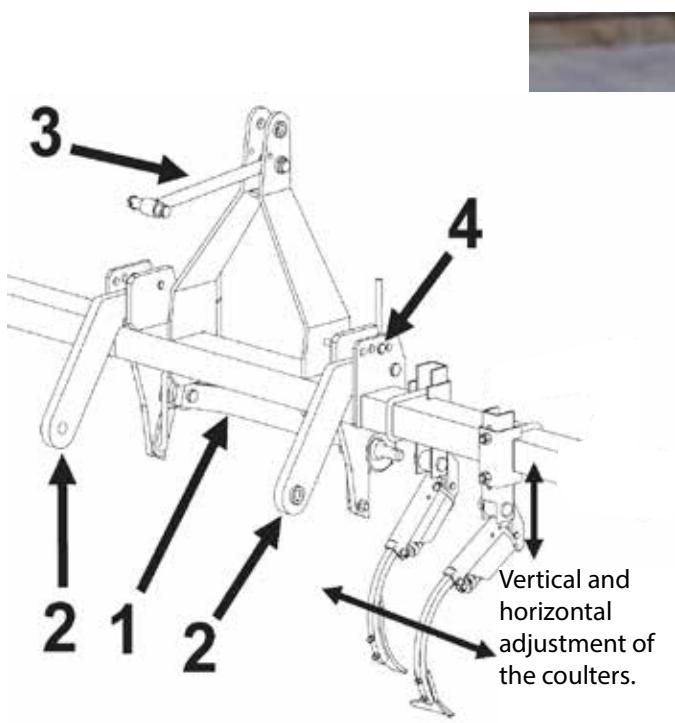

5.5- FLOATING CULTIVATOR

Floating cultivator is part of the optional equipment to prepare the soil before sowing. It is assembled between the tractor and the seed drill.

Couple it to the tractor using an oscillant coupling bar (1). To couple it to the seed drill, use the two coupling arms (2) and a coupling piece (3) which joins both the machine's and the cultivator's three-point linkages.

The cultivator must perform the superficial ground work but the coulters placed on the tractor's tracks must work deeper: they must be adjusted to erase these tracks. Each coulter can be adjusted independently both vertically and horizontally.

The cultivator can be adjusted at four different working depths by switching the bolt's position (4). Being a floating cultivator allows its lateral and vertical movement to be independent from the seed drill. Thanks to this feature, the cultivator can be raised using the tractor's lift keeping at the same time the seed drill on the ground.

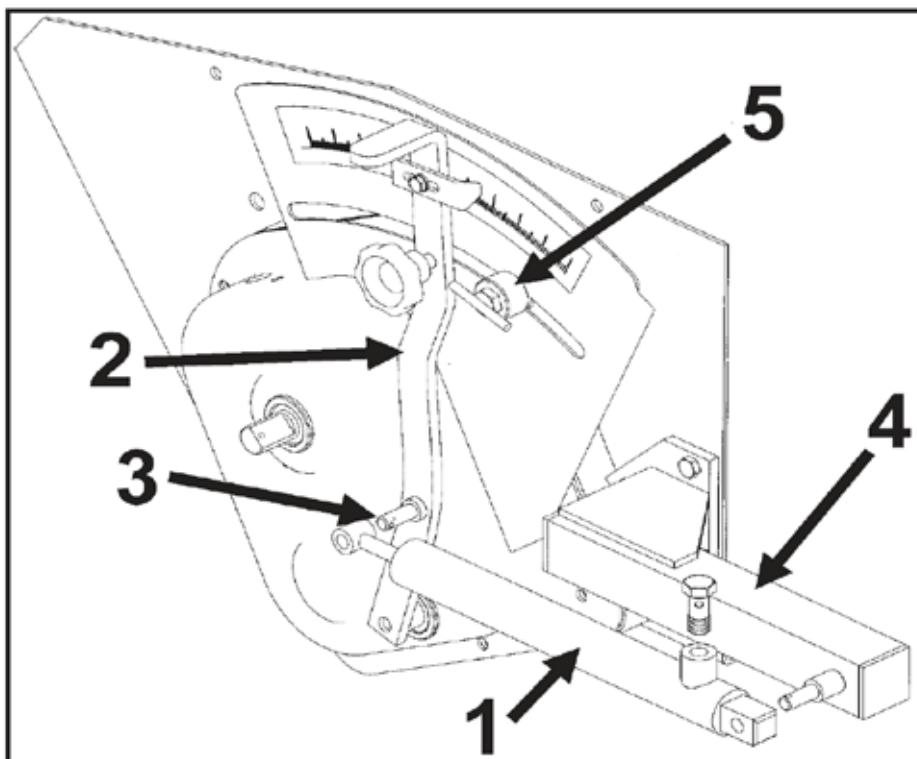

5.6- GEARBOX'S HYDRAULIC CONTROL

EGearbox can be equipped optionally with a hydraulic control to be used remotely.

The cylinder (1) must be assembled to gearbox's lever (2) using a bolt (3). It must be also assembled to the side of the machine using a screwed down support (4). The cylinder is supplied with a hydraulic hose line which must be plugged to a 1/2" tractor control unit.

The gearbox's hydraulic control consists of a single acting hydraulic cylinder with internal return spring, which sets the gearbox lever to "closed" (pressurised circuit) or "sowing" (unpressurised circuit).

HIGH PRESSURE OIL MAY ESCAPE, PASS THROUGH THE SKIN AND INGRESS INTO THE BODY, CAUSING SERIOUS INJURIES. KEEP HYDRAULIC HOSE LINES IN GOOD CONDITION.

6- MAINTENANCE

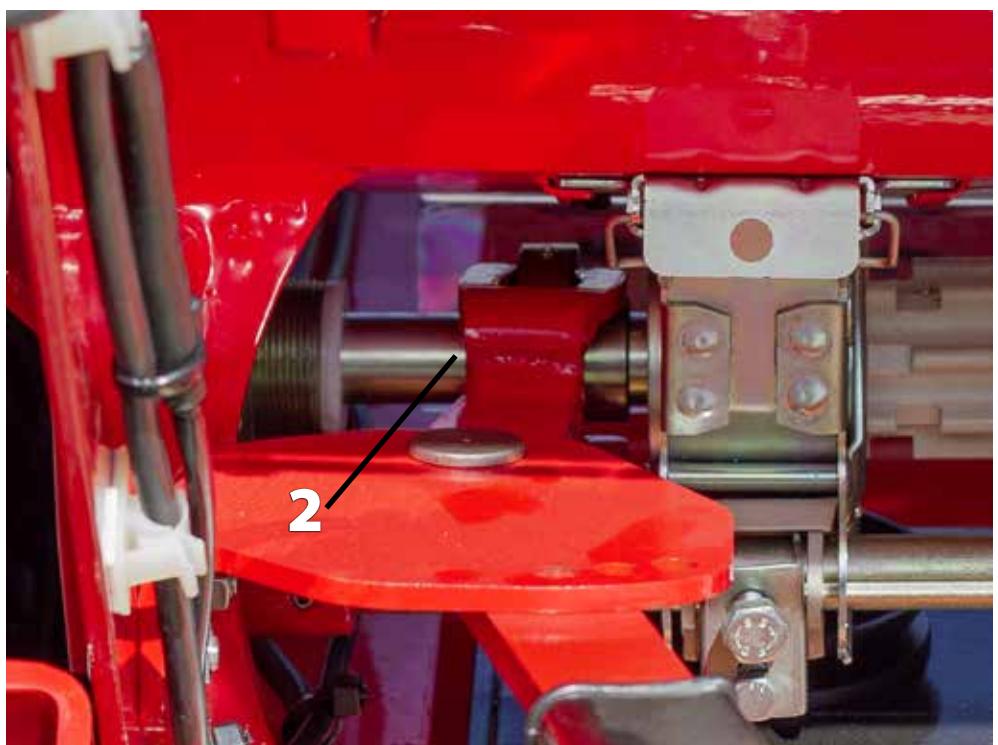

6.1- LUBRICATION

The following parts should be lubricated periodically:

Wheels's bushings, releasing the push-in cap. Use solid calcium grease (1)

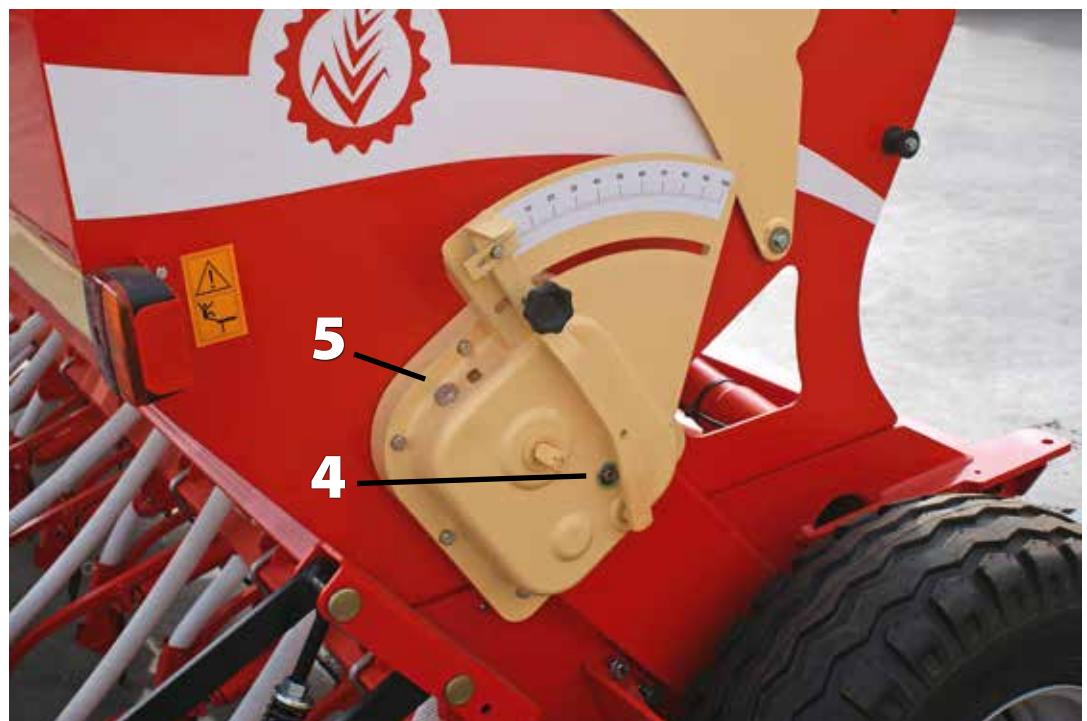

The central adjuster spindle. Use solid calcium grease (2)

The seed dosing lever's roller guide. Use solid calcium grease. (3)

Check the gearbox's oil level by using the peephole ([MIRILLA?? LITTLE WINDOW??](#)) (4). If necessary, remove the cap (5) and refill it with oil type SAE 30.)

NEVER LUBRICATE THE SEED WHEELS.

6.2- TYRES PRESSURE

Indicated pressures are provided by the manufacturer, at maximum load.

Tyres	Pressure
10/75-15,3	6 kg/cm ²

In general use and especially when working on irregularly tilled terrains, it is recommended to use a slightly lower pressure to absorb the ground's irregularities and get a higher regularity in sowing.

6.3- SCREWS

After working for some hours, all screws should be checked and tightened. Put special attention to the ones which fix the tines to the coulter. For these ones, a special socket wrench is supplied which it is placed inside the hopper.

6.4- ANTIOXIDE CONTROL

Once the sowing season is finished, antioxide maintenance must be carried out as follows.

- a) Dismantle the pipes, nozzles and shutoff gates. Clean them thoroughly.
- b) Wash with water jet the whole machine, specially inside the hopper and the dispensers (with the covers removed). Turn the right wheel so that the seed wheels can be completely washed.
- c) Give a coat of paint to those parts with oxidation signs, specially those made of metal sheet.
- d) Verify the general greasing.

6.5- PROBLEM-SOLVING

In this chapter, user will find a guide to solve the most frequent problems that arise from a regular use of the machine.

Dosing system do not dose evenly.

- Check there is no external elements inside the seed wheel's box.
- Check that all shutoff gates are completely open.
- Check that all base flaps are correctly aligned.
- Check if the seed wheel show any worn out or damaged part.
- Do not work in very narrow circles: this carries an uneven seed dosing

Dose dispensed is lesser than expected or zero.

- Follow steps as described in this manual to adjust the correct dose, paying special attention to tyre's pressure, turning of the wheel on the ground, etc.
- Check that the tractor's hydraulic arms are completely lowered so that the drive wheel makes contact with the ground.
- Check the pin which connects the gearbox and seed wheel's axle.
- Check that scrapers are not slowing the drive wheel down.
- Check that the drive system is in good condition: bushing's teeth, chain and gearbox's pinion must them all not be worn out or show any damage.
- If none of the previous solutions turn out to be useful, contact your closest dealer SOLÀ with the gearbox. Do not try yourself to repair this part.

SEED DOSING TABLE

Gearbox value		Wheat	Barley	Triticale	Peas	Beans	Rape	Sainfoin	Vesce	Ray-gras	Lucerne	Spinach	Flax	Oats
Position	Wide	Wide	Wide	Wide	Wide	Narrow	Wide	Narrow	Narrow	Narrow	Narrow	Wide	Wide	Wide

7- SPARE PARTS

7.1- INTRODUCTION

The terms RIGHT, LEFT, FRONT and REAR refer to the machine in its starting direction.

When guidance describes parts that have a matching pair (symmetrical handles, wheels etc) only one will be demonstrated in the drawings shown. Please search for the distinguishing reference in the spare parts list.

When asking for spare parts, please provide the number and type of the machine that can be found on the machine's IDENTIFICATION PLATE.

BE CAREFUL WHEN MAINTAINING THE SEED DRILL, SHARP EDGES CAN CAUSE INJURY

DO NOT WORK UNDER THE MACHINE WHEN IT IS RAISED. ALWAYS SECURE THE MACHINE PROPERLY TO PREVENT IT FROM COLLAPSING AS A PRESSURE LOSS IN THE TRACTOR CAN OCCUR
