# 1.- INTRODUCTION

Before you proceed to operate the seed drill, please read and observe these instructions. In this way, you will avoid accidents, reduce repair costs and downtimes and increase the reliability and service life of your seed drill.

This operating manual must be read and used by all persons who are required to work with the machine (including preparatory work, troubleshooting during operation, care), maintenance (inspection and technical assistance) and transporting.

Pay particular attention to the safety instructions. SOLÀ can not assume any liability for damage or malfunctions caused by a failure to observe the instructions contained in this operating manual.

First of all, the manual will explain the Technical Specifications and the Safety Instructions. In the chapters launching, adjustments and maintenance, the manual will explain the basic instructions for working with the machine. This manual is finished with a Dosage tables with different seed types and a Spare Parts list.

SOLÀ RESERVES THE RIGHT TO MAKE CHANGES TO THE ILLUSTRATIONS, TECHNICAL SPECIFICATIONS AND WEIGHTS CONTAINED IN THIS OPERATING MANUAL IF SOLA MAKES ANY IMPROVEMENTS TO THE MACHINES AND CONSIDERS THE MODIFICATIONS CAN HELP TO IMPROVÉ THE MACHINES QUALITY.

## 2.- SAFETY INSTRUCTIONS

### 2.1 SAFETY SYMBOLS

You are going to find, in this operating manual, three types of safety and danger symbols:

To facilitate operation with the machine

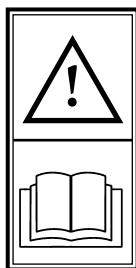

To avoid damages on the machine or on the optional equipments

To avoid personal damages

On the machine, you are going to find the following symbols:

Please, read with care all safety instructions and use instructions contained in this operation manual.

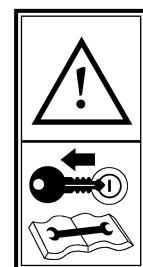

Danger of serious lesions.

Do not place under track markers.

Stay away from the tractor back part during the coupling operation.  
**Danger of serious lesions.**

Stop the tractor engine and avoid its start during the maintenance or repairing works in the seed drill.

## **2.2 GENERAL SAFETY ARRANGEMENTS**

Before to start the machine, it is very important to read the instructions concerning operation safety and road safety.

Road traffic regulations must be observed when towing the machine on roads.

No persons may be allowed to ride on the machine during the work and during the transport.

Before to bring into operation the machine, it is very important to know the parts, the elements and the performances.

Be extremely careful when coupling and uncoupling the seed drill to tractor. This operation involves a high risk of injury.

The transmission of the power point must be fitted with a protective equipment and in good conditions. Avoid the turns of the protector tube securing it with the chain. The side of the clutch will be fit in the seed drill.

The transmission of the power point must be fitted when engine is stopped.

Before connecting the power point, make sure that nobody is standing in dangerous proximity to the machine.

Do not never abandon the seat drive during the work.

Do not place strange elements inside the hopper.

Before carrying out care or maintenance work, always depressurize the hydraulic system and switch off the tractor engine.

The hydraulic system generates extremely high pressures. All piping, hoses and connections must therefore be checked regularly for leakage and visible external damage. Useful life for these elements is not more than six years. You must change them after this time.

To park the machine, to secure it with two stabilizers, one in the first row and the other in the last.

Before to start a movement with a folding machine, be sure the frame is completely folding.

## 2.3 DELIVERY

To load and unload machines PROSEM, use the two holes of the frame placed behind the fan.

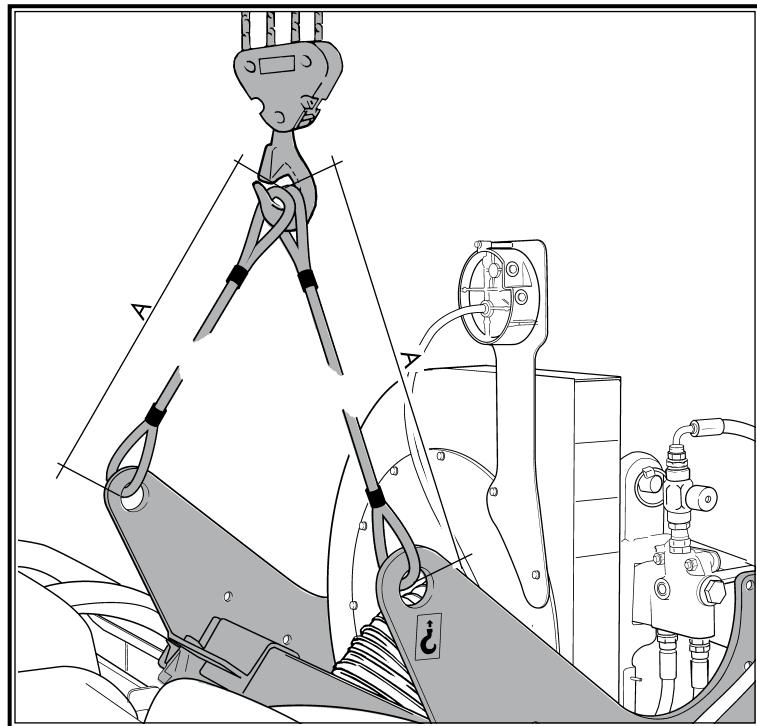

### ATTENTION

RESPECT THE DISTANCE «A» (1,5M) TO AVOID DAMAGES TO THE MACHINE DURING DE RAISING PROCESS.

To receive the machine, check it, possible damages caused during the transport and verify all the parts.

Making an immediate complaint to the carrier you can obtain a replacement for damages.

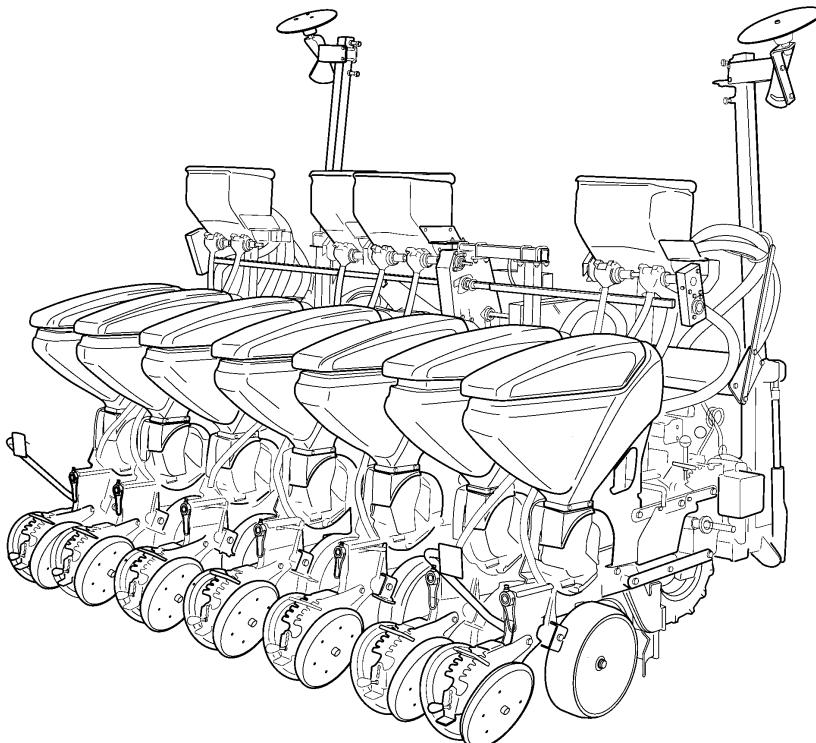

## 3.- GENERAL DESCRIPTION

Seed drills PROSEM has been produced for the agricultural works, specially for precision sowing.

SOLA cannot be held liable for any consequential damage resulting from incorrect use, metering or distribution.

All relevant accident prevention regulations, as well as other generally acknowledged safety and road traffic regulations, must be observed.

SOLA seed drills are intended for sowing. Any uses or modifications other than those will automatically exempt SOLA from its/his liability in respect on ensuing damages.

### 3.1 MACHINE IDENTIFICATION

On the identification plate we find the following points:

Model.

Building year.

Machine type.

Frame number.

## 3.2 STANDARD EQUIPMENT

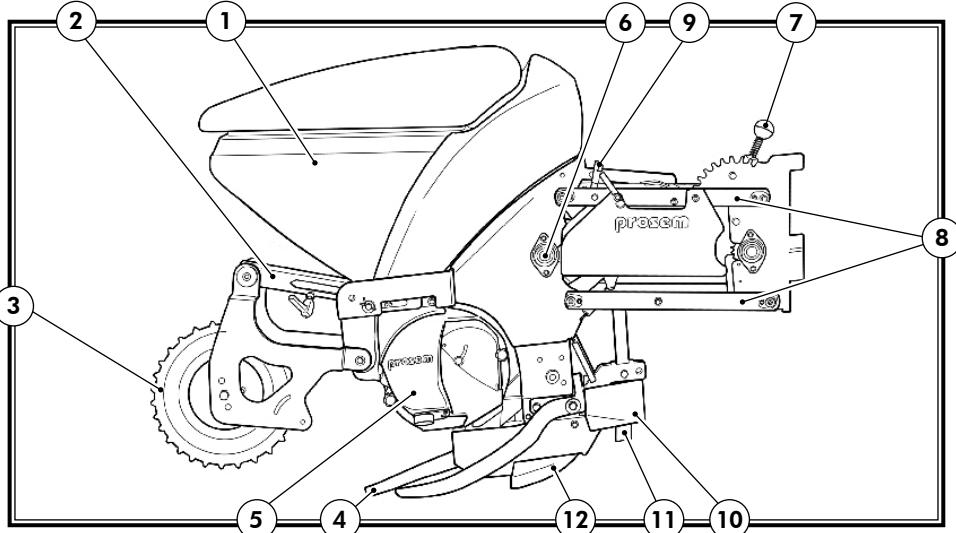

- Mud remover with opening-furrow coulter.
- Rows manual exclusion.
- Hydraulic disc markers.
- One distributor disc for row.
- Vacuum gage.
- Cardan transmission.
- Double traction wheels at the front part.
- Seed hopper (50 Lts/row).
- Back lights equipment for public thoroughfare.

## 3.3 OPTIONAL EQUIPMENT

- Opening turbo disc (Prosem K).
- Opening disc (Prosem K).
- Undulating opening disc (Prosem K).
- Removestubble Stars (Prosem K).
- Intermediate wheel.
- Hectare counter.
- Automatic rows exclusion (electro-mechanical).
- Sowing electronic control.
- Fertilizer with discs.
- Fertilizer with coulters.
- Microgranulator.
- Antislugs.
- Long transport (F600/8).
- Sowing discs.

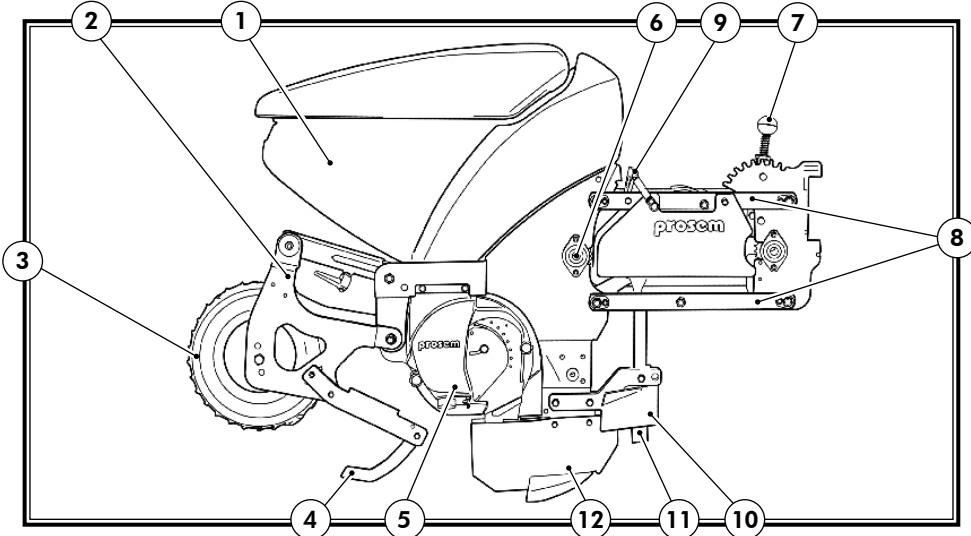

### 3.4 SOWING ROW PROSEM P

1. Seeds tank.
2. Sowing depth adjustment.
3. Compression wheel: soil compressor and sowing depth control.
4. Furrow closing device.
5. Distributor: with a selector to adjust seed distribution.
6. Transmission group: move the action from the main axle to the distributor for the sowing disc rotation.
7. Row pressure adjustment lever: adjust the load pressure exercised for the sowing row on the soil.
8. Parallel motion: connect the sowing row to the machine frame.
9. Coupling mechanism.
10. Mud remover: avoid big mud coinciding with sowing furrow.
11. Coulter: for breaking the soil superficial bed .
12. Coulter: make the furrow on the soil where the seed will be placed.

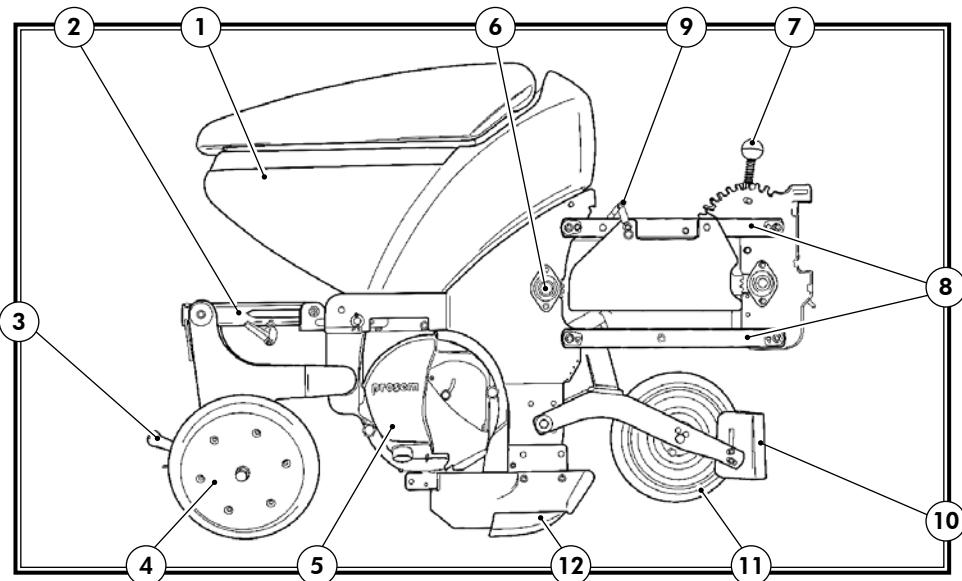

### 3.5 SOWING ROW PROSEM P HIGHT COULTER

1. Seeds tank.
2. Sowing depth adjustment.
3. Compression wheel: soil compressor and sowing depth control.
4. Furrow closing device.
5. Distributor: with a selector device to adjust seed distribution.
6. Transmission group: move the action from the main axle to the distributor for the sowing disc rotation.
7. Row pressure adjustment lever: adjust the load pressure exercised by sowing row on the soil.
8. Parallel motion: connect the sowing row to the machine frame.
9. Coupling mechanism.
10. Mud remover: avoid big mud coinciding with sowing furrow.
11. Tooth furrow: make the furrow on the soil where the seed has to be placed.
12. Tooth furrow: make the furrow on the soil where the seed has to be placed.

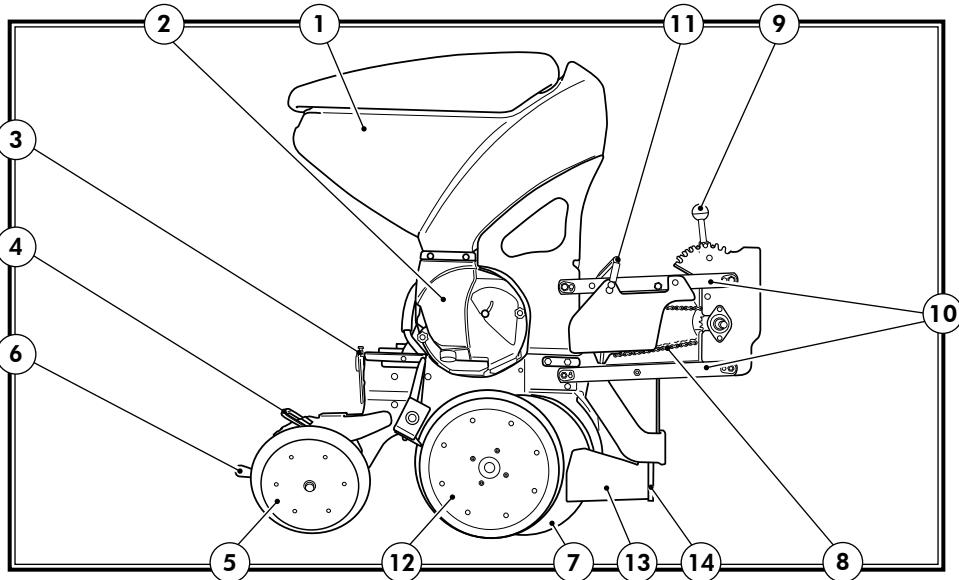

### 3.6 SOWING ROW PROSEM P BEAM

1. Seeds tank.
2. Sowing depth adjustment.
3. Pressure adjustment lever for the seed compressor wheels.
4. Seed compressor wheels: close the furrow where the seed has been placed.
5. Distributor: with a selector device to adjust seed distribution.
6. Transmission group: move the action from the main axle to the distributor for the sowing disc rotation.
7. Lever to adjust row pressure: adjust load pressure exercised by sowing row on the soil.
8. Parallel motion: connect the sowing row to the machine frame.
9. Coupling mechanism.
10. Mud remover: avoid big mud coinciding with sowing furrow.
11. Front wheel for depth control.
12. Tooth furrow: make the furrow on the soil where the seed has to be placed.

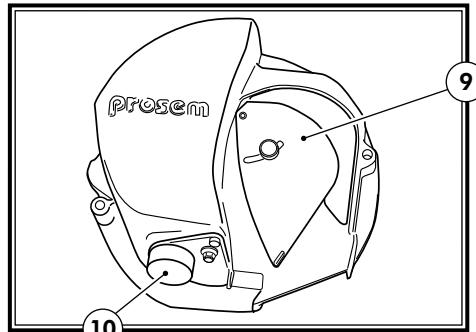

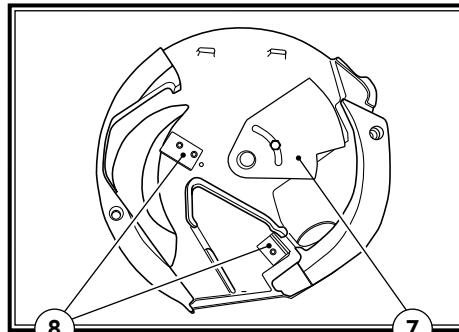

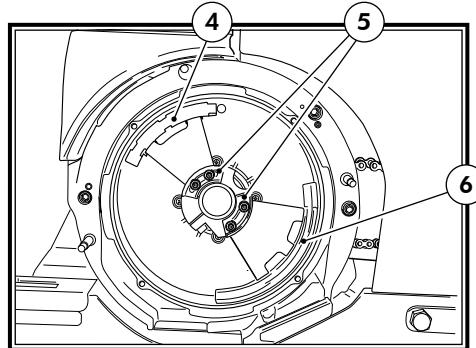

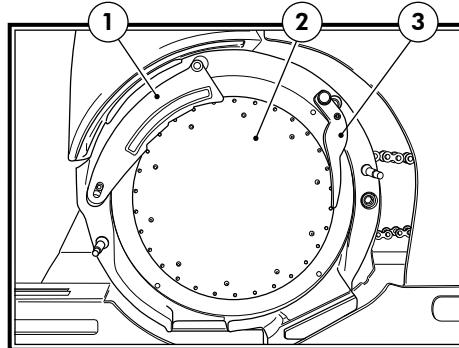

### 3.7 SOWING ELEMENT PROSEM K

1. Seeds tank.
2. Distributor: with a selector device to adjust seed distribution.
3. Crank to adjust sowing depth.
4. Pressure adjustment lever for the seed compressor wheels.
5. Seed compressor wheels: close the furrow where the seed has been placed.
6. Adjustment lever for the compression wheels incidence angle.
7. Opener double disc: made the furrow where the seed has been placed.
8. Transmission group: move the action from the main axle to the distributor for the sowing disc rotation.
9. Lever to adjust row pressure: adjust load pressure exercised by sowing row on the soil.
10. Parallel motion: connect the sowing row to the machine frame.
11. Coupling mechanism.
12. Sowing depth control wheels.
13. Mud remover: avoid big mud coinciding with sowing furrow.
14. Coulter: bread the soil superficial bed.

### 3.8 SEED DISTRIBUTOR

1. Seeds selector: select one seed by hole.
2. Sowing disc: seeds distributor disc.
3. Seeds knockout: seed falls in the correct point.
4. Contra-selector follower: avoid selector can break some seeds
5. Central followers
6. Follower of seed falls: close the aspiration when the seed has to detach to the disc.
7. Distributor seed door: adjust the distributor seed entry.
8. Brush: disc cleaner
9. Inspection door: allow see one seed per hole.
10. Empty door: to empty out the hopper.

### 3.8.1 SOWING DISCS (optional)

- Corn: 30 or 20 or 40 holes Ø 4.5 mm.
- Little corn: 30 or 40 holes Ø 3.5 mm and 30 or 20 holes Ø 4 mm
- Sunflower: 20 or 10 or 30 holes Ø 2.5 mm (Ø 1,5 or Ø 2 mm for little sunflower).
- Sugarbeets: 30 holes Ø 2 mm for monogerm sugarbeet (with or without pill) (also with 20 or 40 holes).
- Cotton: 100 or 70 holes Ø 3.5 and Ø 3 mm
- Chickpea: 50 or 60 holes Ø 5,5 and Ø 4,5 mm (or 70 holes Ø 5 mm)
- Beans: 50 or 60 holes Ø 3,5 and Ø 4,5 mm (or Ø 2,5 for little beans).
- Soybeans-peas: 70 holes Ø 4 and Ø 4,5 mm.
- Sorghum: 70 or 100 holes Ø 2 mm.
- Rape: 70 or 120 holes Ø 1,1 mm.
- Broad beans: 30 holes Ø 6,5 mm

Also we have discs for garlic, leek, cauliflower, peanut, melon, cucumber, lupin, onions, millet, tomato, wheat, fennel, asparagus, spinach, radish, carrot...

### 3.9 FERTILIZER EQUIPMENT (optional)

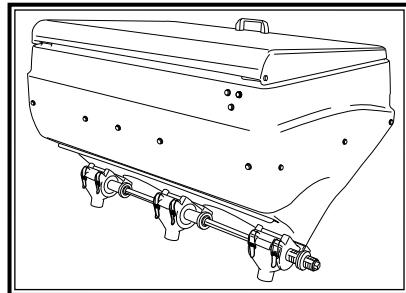

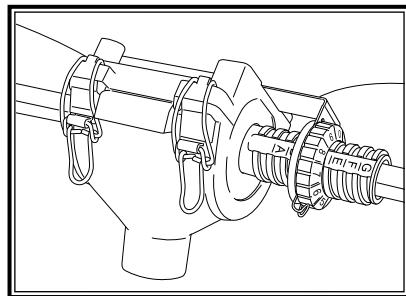

The fertilizer group has the function to distribute on the soil the fertilizer products, during the sowing.

We are doing the fertilizer dosage by the fertilizer distributors adjustment placed under the fertilizer hoppers.

Each machine is fitted with an even number of hoppers depending on the rows number.

Each hopper could have 2 or 3 exits. P.e. one machine of 6 rows has 2 hoppers of 3 exits.

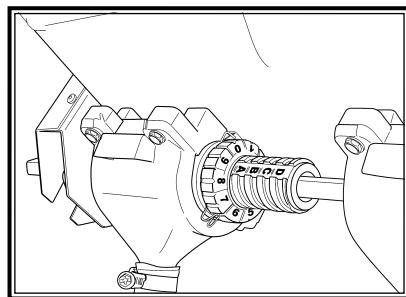

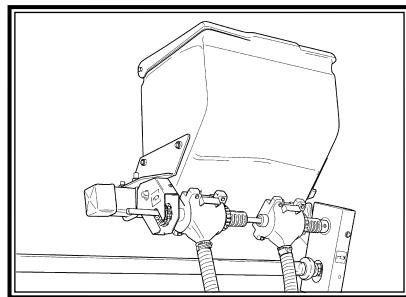

The fertilizer equipment is fitted with a coulters and discs that allow to bury the fertilizer by the side of sowing row.

### 3.10 MICRO DISTRIBUTOR EQUIPMENT (optional)

The micro distributor equipment has de function to distribute during the sowing some anti parasites as insecticides and or anti-slugs. Also it can apply some fertilizer micro granulated at the beginning.

Insecticides and beginning fertilizers are distributed in the sowing furrow joint to the seed. Anti-slugs products are distributed over the sowing row.

## 5.- USE INSTRUCTIONS

Before using the machine it is very important to consider the following points:

- Verify the machine is coupled to the tractor.
- Verify the machine greasing.
- Verify the wheels pressure.
- Verify safety elements.
- Prepare the machine to the seed using.
- Verify that tractor driving wheels do not coincide with rows sowing bed.
- Action the empty machine to release tubes of the condensation water or the other strange elements.
- Verify oil level from transmission box (only Telescopic models and Variant)

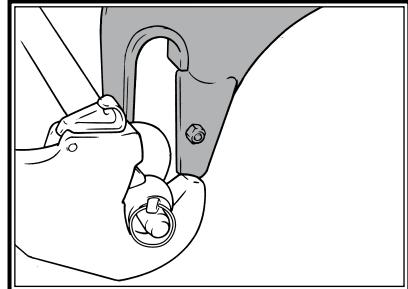

## 5.1 COUPLING THE MACHINE TO THE TRACTOR

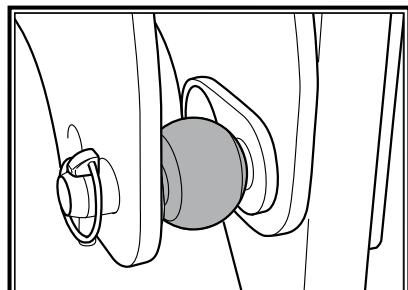

### PREVENTIVE MEASURE

BE EXTREMELY CAREFUL. THESE OPERATIONS INVOLVES A HIGH RISK ON INJURY.

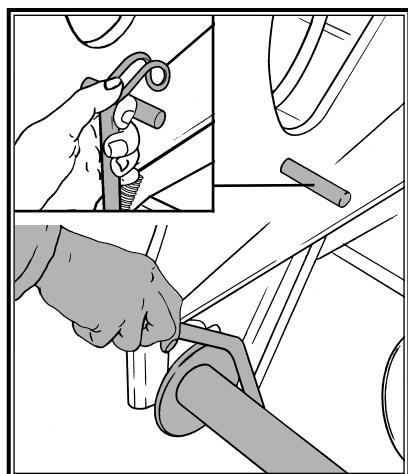

In the machines with coupling bar, fit the fast coupling to the tractor and then place with the tractor, the bar in the machine holes.

In the machines without coupling bar, fit the balls in the machine coupling bolts and then place the tractor arms in these balls.

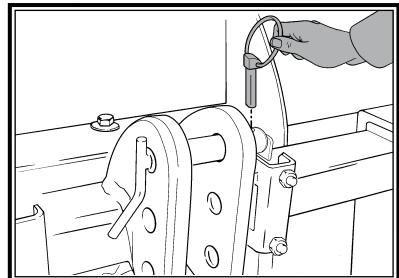

Uncoupling lever and tighten down.

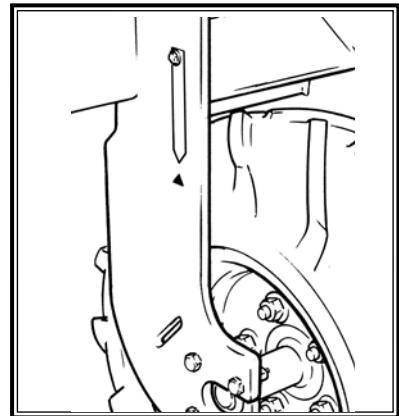

Place the 3 point tie and insert the bolt.

It is very important do not forget place the safety ring.

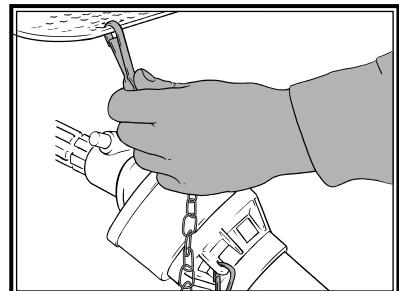

Adjust the tie length to obtain the machine remains parallel to the soil.

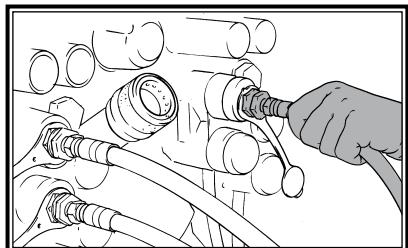

Connect the cardan to the tractor axle.

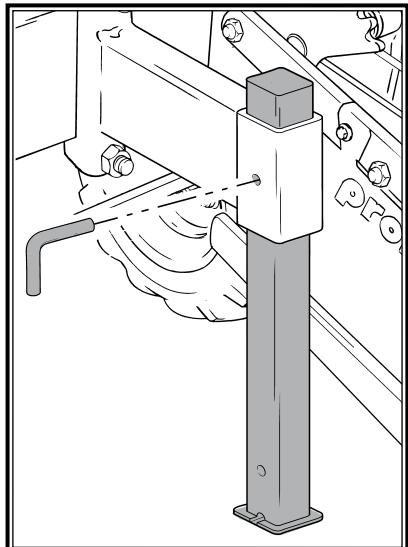

To secure the cardan to the tractor by the backstay.

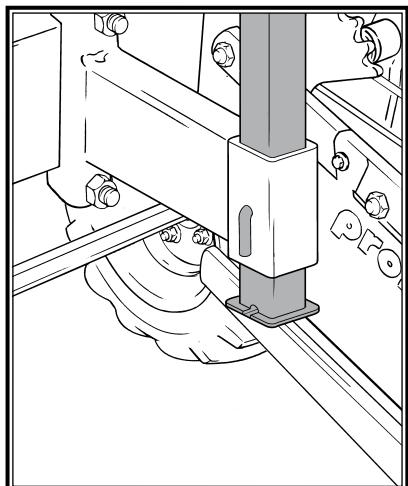

Connect the machine hydraulic tubes to the tractor joints.

Raise the machine support foot.

**VERY IMPORTANT**  
RAISE SUPPORT FOOT BEFORE TO  
START THE MACHINE AND DURING  
THE MACHINE IS WORKING TO  
AVOID SERIOUS DAMAGES.

## 5.2 TRANSMISSION ROW EXCLUSION

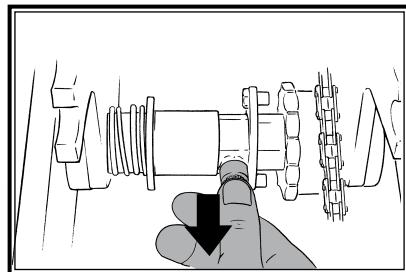

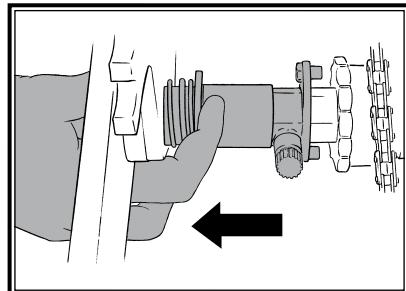

### ATTENTION

THE OPERATIONS MUST BE DONE WHEN THE POWER POINT IS DISCONNECTED, TRACTOR ENGINE STOPPED AND THE KEYSWITCH DISCONNECTED.

Displace the clutch as we can see in the drawing.

To connect the transmission draw out the handle and the clutch returns at its place.

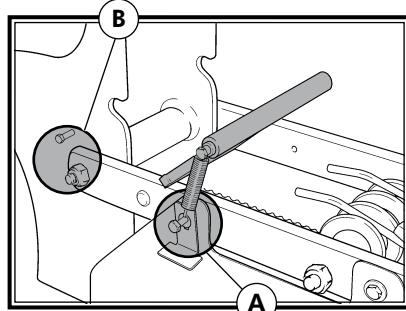

## 5.3 ELEMENT RAISING TO EXCLUDE IT

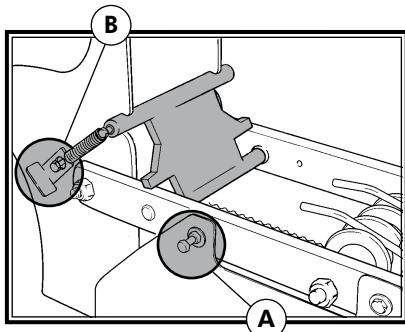

Place the spring in situation A for the row working.

To exclude the row raise the machine to avoid the contact with the soil and coupling the spring in the point B.

Descend the machine until the soil and hold up the row to exclude on a wooden peg of aprox 20 cms.

To uncoupling the row, place the spring in the point A. Place the machine on the soil, supporting the row we want uncouple on a wooden peg.

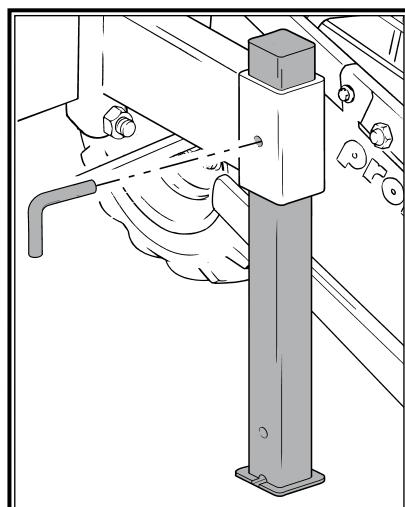

## 5.4 WORKING END

- Empty out the machine tanks to avoid distributors blockage.
- Clean the machine with water, specially the tanks containing chemical products.
- Verify the machine components condition. Replace them it is necessary.
- Eliminate the particles presence to avoid damages. Paint these zones with anticorrosive products if it is necessary.
- Realise the pieces greasing as shown on anterior drawing.
- Grease transmission chains and gears.

## 5.5 MACHINE UNCOUPLING

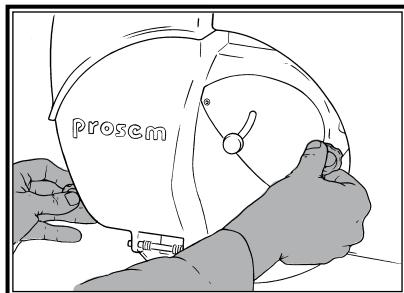

Place the machine support foot.

Change over the steps given in the drawing 5.1.

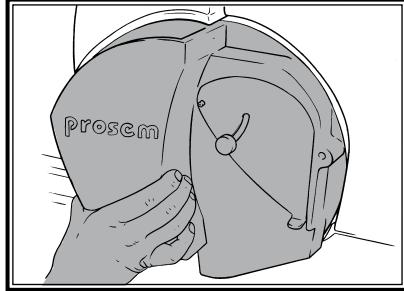

## 5.6 SOWING DISC REPLACEMENT

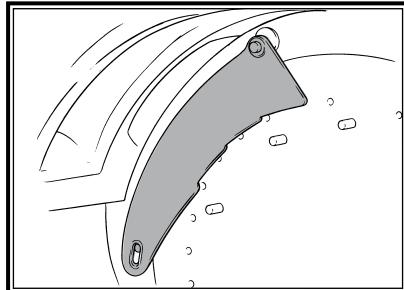

Unscrew the 2 fixation wing nuts.

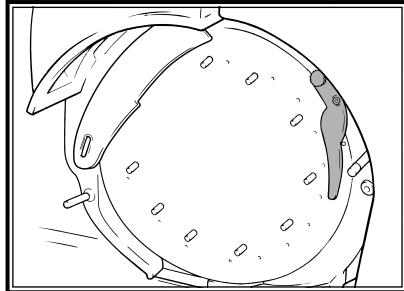

Take out the cover from its position.

Take out the selector from the fastening groove.

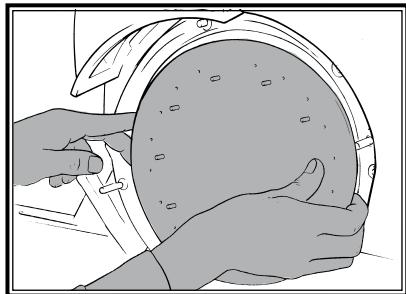

Take out the seeds knout.

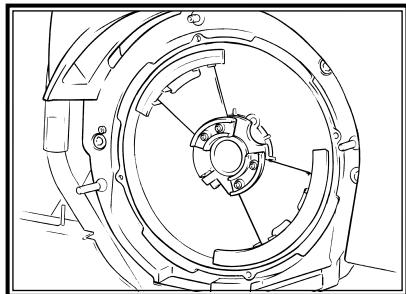

Take hold the disc with the hands and pull for taking out it.

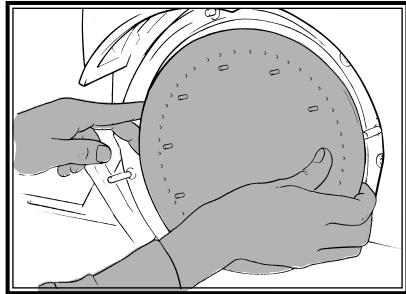

The disc is magnetically fastening.

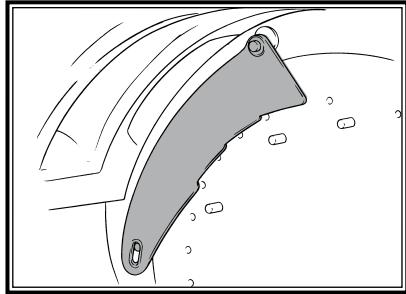

When the sowing disc is out of its place, we can see the distributor vacuum bell.

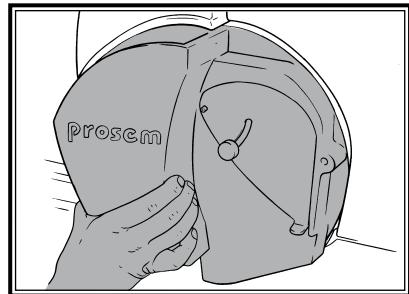

Place the correct sowing disc.

Place the sowing selector and the seed knockout.

Place the cover and tighten it by the 2 wing nuts.

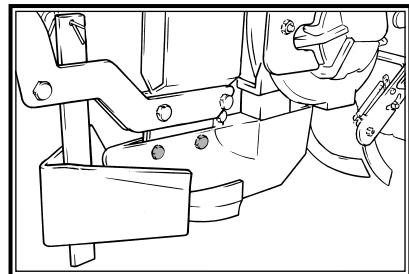

## 5.7 SOWING BOOTS REPLACEMENT (Prosem P)

Hold the boot.

Slack the 2 screws and the 2 bolts.

Pull and replace it.

Fix it with the same screws and bolts.

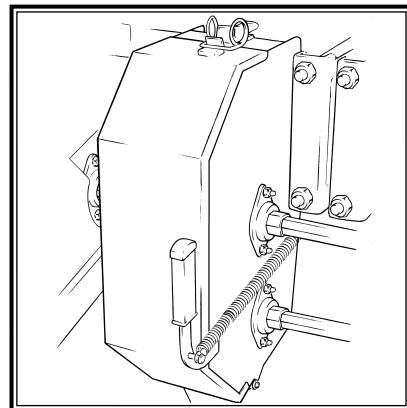

# 6.- ADJUSTMENTS

## 6.1 SOWING DISTANCE ADJUSTMENT

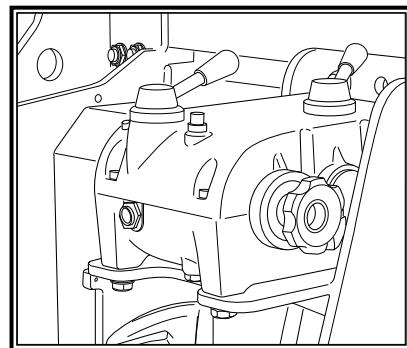

To adjust the distance between plants in the sowing line and also the quantity per hectare to sow, we have to intervene in the machine transmission relation. In order to realise the operation the machine takes a gearbox.

**Depending on the machine type, seed drills Prosem takes 2 gearbox types:**

- 1- Traditional gearbox. With chain (see drawing).

- 2- Automatic gearbox (see drawing).

Depending on the machine gearbox, you are going to use the adjustment table (see points 6.1.1 or 6.1.2). On the tables you can find the relations according the distribution holes number.

Total sowing population (plants number per hectare) is indicated for the machine rows distance and the plants distance (see table).

**SEEDS TABLE PER HECTARE**

Rows distance (cm)	45	50	55	60	65	70	75	80	90	95

	<b>C2</b>	65,1	32,6	21,7	16,3	13,0	10,9	9,3	6,5	5,4
	<b>C1</b>	72,0	36,0	24,0	18,0	14,4	12,0	10,3	7,2	6,0

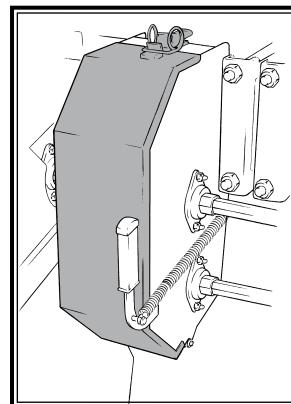

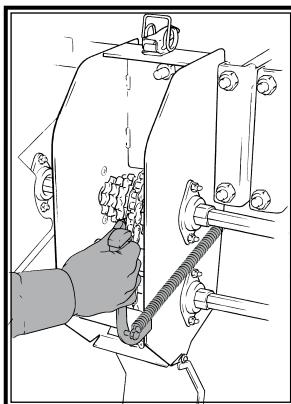

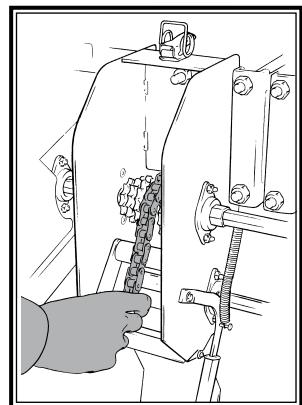

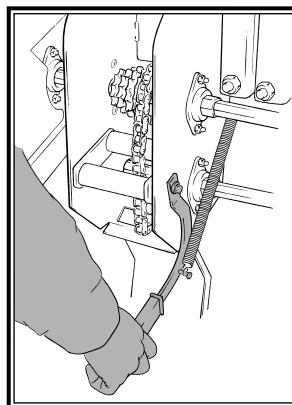

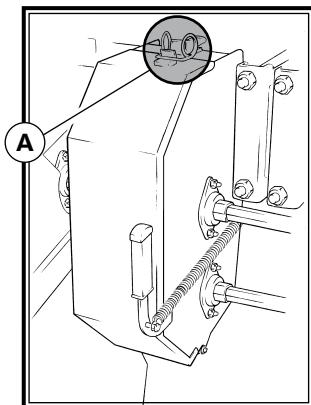

PLANTS DISTANCE (cm)

Before to modify transmission relation, be sure the pinions position is correct respect our disc holes number and the plants distance.

To modify the transmission relation, we are going to do:

- Open the transmission cover by device A.
- Press the lever downwards to slacken the chain.
- Place the chain in the transmission, as the table before. The group of 3 pinions are the words A-B-C and the group of 6 pinions are the numbers 1-2-3-4-5-6.
- Tighten the chain by the lever and leaving it at he initial position.
- Close the cover.

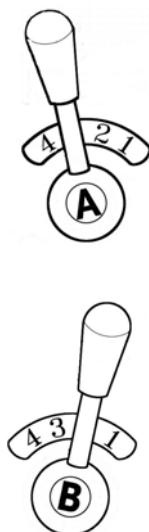

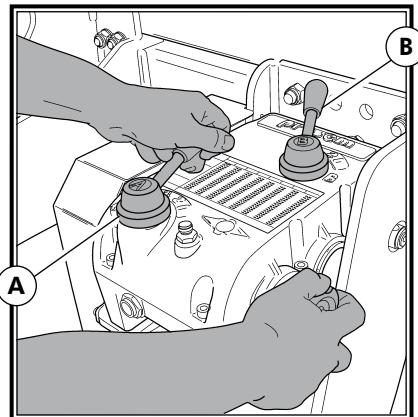

## 6.1.2 AUTOMATIC GEARBOX

Before to modify the transmission relation, be sure that the levers position of the automatic gearbox is correct with reference to our disc holes number and concerning plants distance.

### To modify the transmission relation:

- Hang up the machine to avoid contact between the transmission wheels and the soil.
- Place lever "A" in the correct position and turn the wheel in advance direction until the change comes in. Repeat the operation with the lever "B". If after turning 3 or 4 times, the change does not come in, adjust the lever position until the correct point.

LEVER		DISC HOLES NUMBER								
A	B	10	20	30	40	50	60	70	100	120
1	1	32,4	16,2	10,8	8,1	6,5	5,4	4,6	3,2	2,7
1	2	34,2	17,1	11,4	8,5	6,8	5,7	4,9	3,4	2,8
1	3	36,1	18,0	12,0	9,0	7,2	6,0	5,2	3,6	3,0
1	4	38,0	19,0	12,7	9,5	7,6	6,3	5,4	3,8	3,2
2	1	40,1	20,0	13,4	10,0	8,0	6,7	5,7	4,0	3,3
2	2	42,3	21,1	14,1	10,6	8,5	7,0	6,0	4,2	3,5
2	3	44,6	22,3	14,9	11,1	8,9	7,4	6,4	4,5	3,7
2	4	47,0	23,5	15,7	11,8	9,4	7,8	6,7	4,7	3,9
3	1	49,5	24,7	16,5	12,4	9,9	8,2	7,1	4,9	4,1
3	2	52,2	26,1	17,4	13,0	10,4	8,7	7,5	5,2	4,3
3	3	55,0	27,5	18,3	13,8	11,0	9,2	7,9	5,5	4,6
3	4	58,0	29,0	19,3	14,5	11,6	9,7	8,3	5,8	4,8
4	1	62,4	31,2	20,8	15,6	12,5	10,4	8,9	6,2	5,2
4	2	65,8	32,9	21,9	16,5	13,2	11,0	9,4	6,6	5,5
4	3	69,4	34,7	23,1	17,4	13,9	11,6	9,9	6,9	5,8
4	4	73,3	36,6	24,4	18,3	14,7	12,2	10,5	7,3	6,1

PLANTS DISTANCE (cm)

## 6.2 SEED DISTRIBUTION ADJUSTMENT

**Three adjustments that have influence in the seed distribution quality are:**

1. Selector position with reference to the disc holes. Adjust the selector position depending on the seed to sowing.
2. The position of the seed knockout with reference to the disc holes. To improve the distribution, the Prosem distributor has a pawl to eject the seeds.
3. The suction power (drawdown) existing at the disc level. It is necessary to adapt the suction power to the seed weight to sowing.

### 6.2.1 SELECTOR ADJUSTMENT

Selector lever adjusts from number 0 to 10. If we turns the lever to a large number, we remove the selector to the hole and we have to increase suction capacity promoting a tendency to doubles. The other way, if we turn the level to a minor number, we approach the selector the sole and we reduce the suction capacity promoting a tendency to the errors.

**Advised selector positions:**

- |                                      |                          |
|--------------------------------------|--------------------------|
| • Corn: 3,5                          | • Sorghum: 2,8           |
| • Sunflower: 2,8                     | • Soybean-peas: 3,5      |
| • Coated sugar beet: 3,5             | • Uncoated sugar beet: 3 |
| • Broad beans: 10 (special selector) | • Rape: 3,2              |
| • Cotton: 5                          | • Chickpeas: 7           |
| • Beans: 5                           |                          |

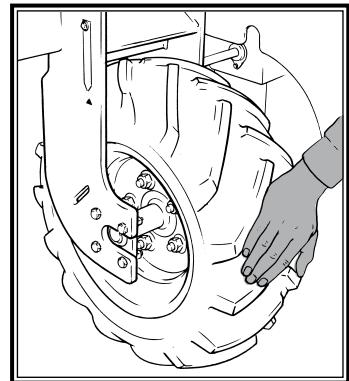

#### ATTENTION

INDICATED POSITIONS ARE FOR GUIDANCE ONLY, CONTROLS IN THE SOWING BEGINNING AND DURING SOWING ARE ESSENTIAL.

**To control selector position, we can do:**

1. Raise the machine from the soil.
2. Start the power point.
3. Turn manually the wheels and verify the seed distribution.

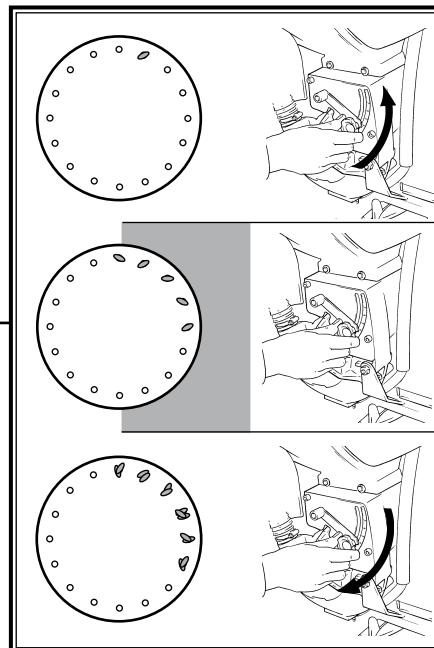

4. Adjust the selector lever position with reference to the seed distribution:

**INCORRECT** seed position. Mistakes in the distributor.

**CORRECT** seed position.

**INCORRECT** seed position. Distributor makes doubles.

Place the lever in a higher number.

Fix the lever.

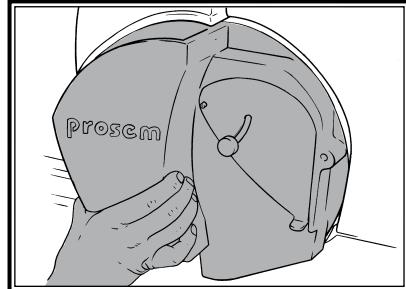

Place lever in a smallest number adjustments.

### 6.2.2 SEED KNOCKOUT ADJUSTMENT

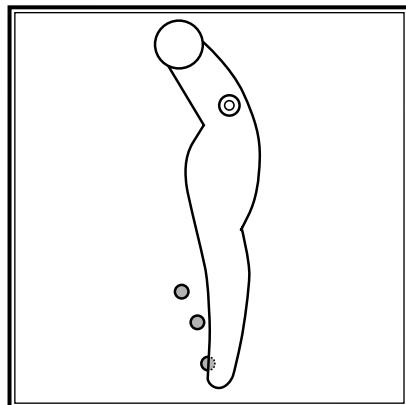

**WARNING.**  
REGULATION MUST BE DONE BEFORE LOAD THE HOPPER.

For acceding to the seed knockout , open the distribution inspection window.

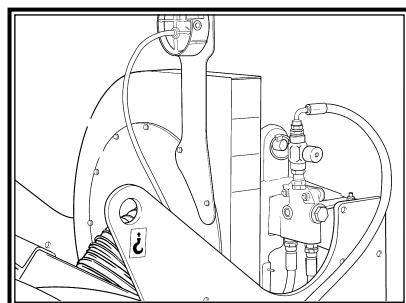

Knockout have to be placed in the way that the last hole rests covered until the middle.

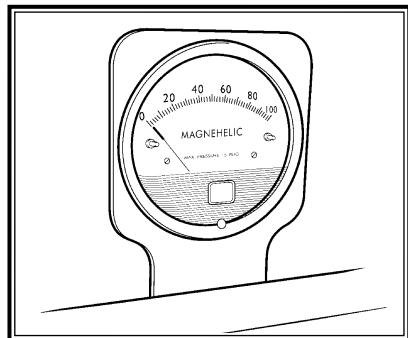

### 6.2.3 SUCTION REGULATION

The suction fan creates vacuum and is connected to distributor by pipes.

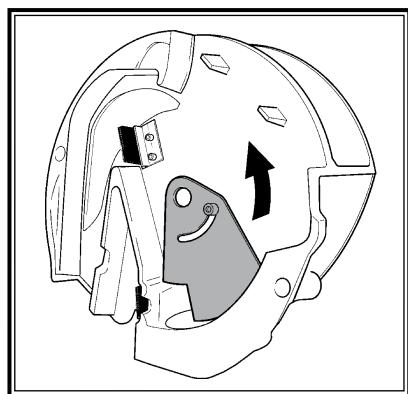

The Vacuummeter is the instrument for the vacuum measuring. The device supplied for the manufacturer shows suction levels between 0 and -100 mbar. Indicative average of the levels, for the big seeds (chickpeas, beans, soya) is between 70 and 80 mbar. For small seeds (beet, sunflower) is between 40 and 50 mbar.

#### 6.2.4 SEED ADJUSTMENT TO THE DISTRIBUTOR

This door allows adjust seed level in the distributor. When we use pilled seeds (exemple beet), disc turn over the seeds can break them.

In this case, close the seed access door to obtain a minimal quantity of seed en contact with the disc in motion.

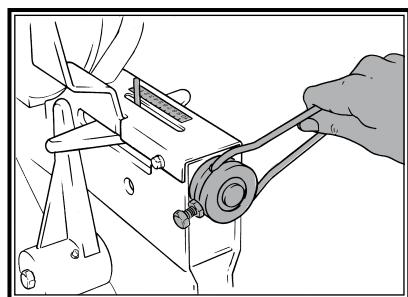

### 6.3 SEED DEPTH CONTROL

#### 6.3.1. ADJUSTMENT FOR THE MODEL PROSEM K

Realize the operations to each elements on the machine.

Turn the crank until obtain the sowing depth shown in the adhesive with scale from 0 to 10.

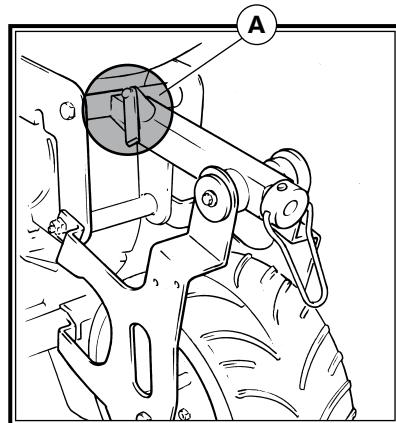

### 6.3.2. ADJUSTMENT FOR THE MODEL PROSEM P

Realize the operations to each elements on the machine.

-Slacken the lever A.

- Turn the crank until obtain the sowing depth shown in the adhesive with scale from 0 to 10.

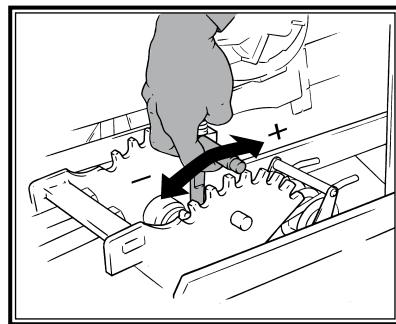

-Fix the position by lever A.

### 6.4 PRESSURE ELEMENT ADJUSTMENT

For the worked soils , decrease the spring rigidity. For the soils with small preparation, increase the spring rigidity.

Draw upwards the lever positioning device and place it in the correct position for the soil where we are going to work.

#### ATTENTION

HOLD ON THE LEVER TO AVOID POSSIBLE DAMAGES IN THE HAND.

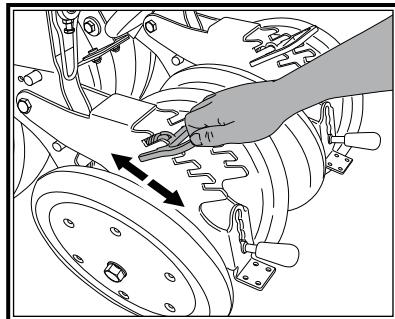

## 6.5 FURROW CLOSING ADJUSTMENT

The wheel adjustments can be done by two ways:

### 6.5.1. PRESSURE ADJUSTMENT ON THE SOIL.

For the worked soils , decrease the spring rigidity. For the soils with small preparation, increase the spring rigidity.

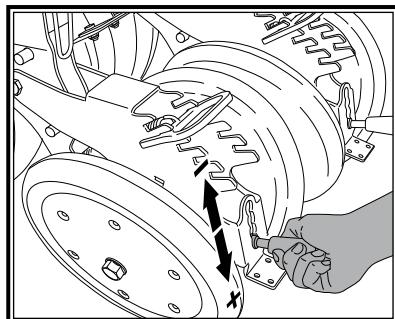

Draw upwards the lever positioning device and place it in the correct position for the soil where we are going to work.

**ATTENTION**  
HOLD ON THE LEVER TO AVOID POSSIBLE DAMAGES IN THE HAND

### 6.5.2. INCIDENCE ANGLE ADJUSTMENT ON THE SOIL

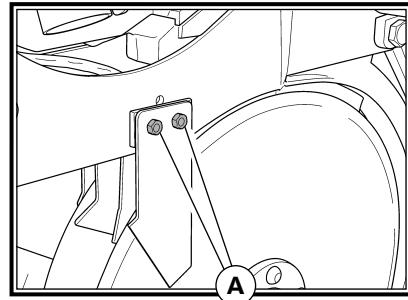

Press the lever inside and place it in the correct position for the soil where we are going to work.

## 6.6 DISC SCRAPERS ADJUSTMENT. SOWING ROWS PROSEM K

By two bolts (A) adjust the internal and external scrapers position of the disc, the scrapers must be in the correct position and avoid they cause friction too much.

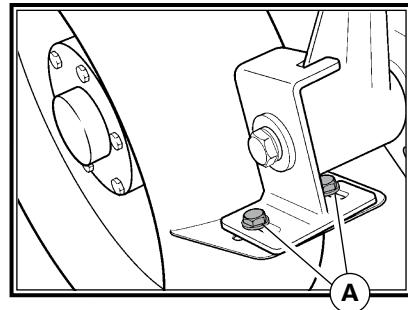

Realize the same operation in the other discs.

## 6.7 SOWING DEPTH CONTROL ADJUSTMENT OF THE WHEEL SCRAPERS (PROSEM K)

By the bolts (A) adjust the wheel scrapers position in order to adjust them correctly.  
(aprox. 3-4mm).

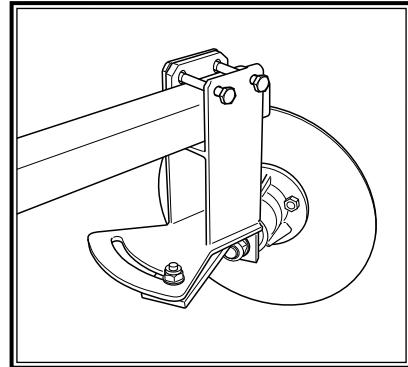

Realize the same operation in the other wheel.

## 6.8 HYDRAULIC DISC MARKERS ADJUSTMENT

### 6.8.1. TRACK MARKERS ADJUSTMENT

Track markers are placed on the frame end with hydraulic motion. For telescopic machines is very important close track markers before machine folding for the transport. Track markers arms are extensible. To calculate the horizontal distance between disc and external row (B), apply the following formula:

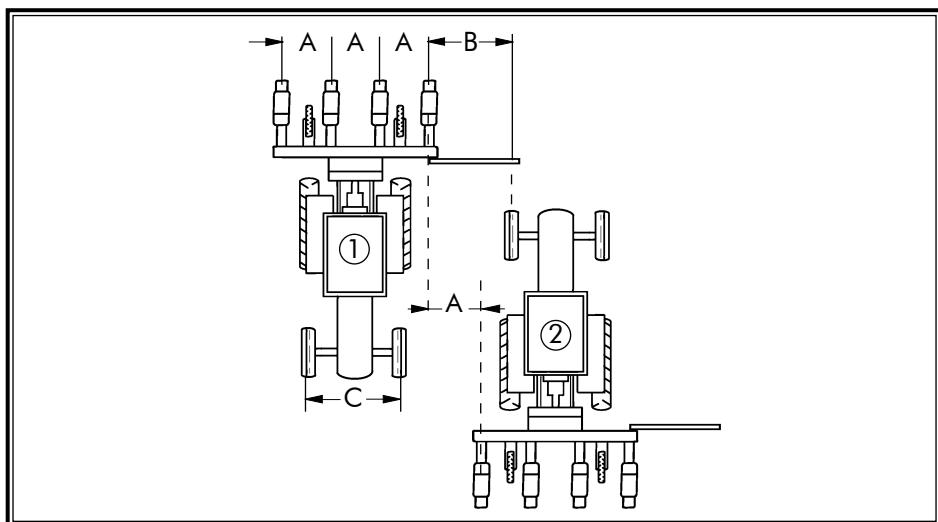

$$B = \frac{A \times (\text{rows distance} + 1) - C}{2}$$

**NOTE:**

A= distance between rows centre.

B= horizontal distance between disc and external row.

C= tractor way wide.

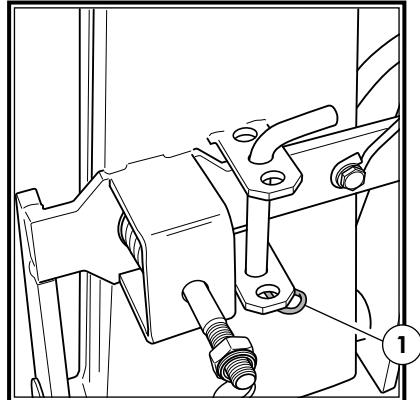

Adjustment allows to maintain the same distance between rows A between race 1 and race 2.

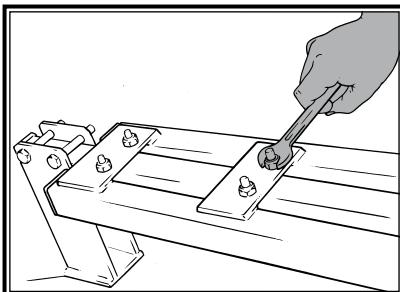

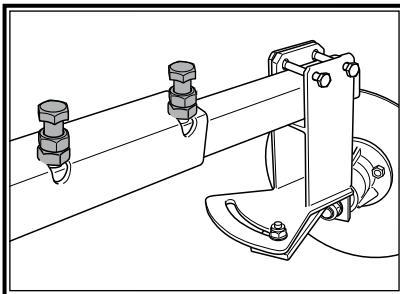

Once calculated the distance B we can adjust the length of the track markers arm.

Draw up the handle (1) and remove the fixing device upwards for unblocking the track markers.

Lower down the track marker.

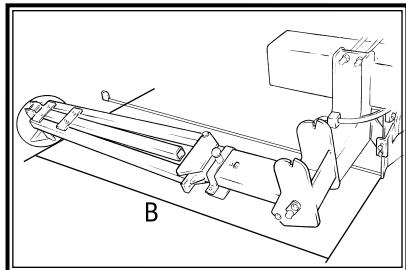

Slacken the fixing bolts.

Place the track marker disc to the distance B .

B= distance between track marker disc and sowing row nearest to the track marker.

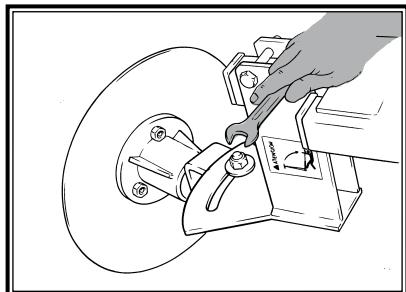

Finally, fix the bolts.

### **6.8.2. ADJUSTMENT OF THE TRACK MARKER DISC INCLINATION**

Adjust the track marker disc inclination slackening the fixing bolt in order to facilitate the disc incidence on the soil.

Fix the bolt at the end of the operation.

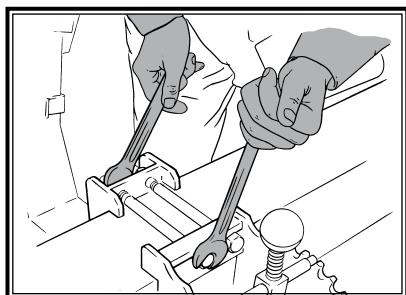

### **6.9 ROWS DISTANCE ADJUSTMENT**

#### **6.9.1. FIX MACHINES**

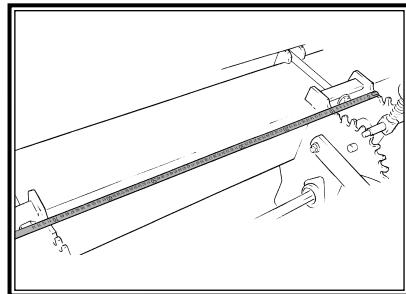

Distance between lines can be regulated depending on the seed we are going to sow.

To adjust the distance in fix machines, operate as following:

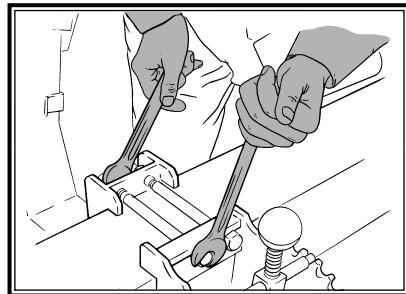

Slacken the bolts by the keys.

By a tape measure, place the rows to the chosen measure.

Fix the rows by the screws.

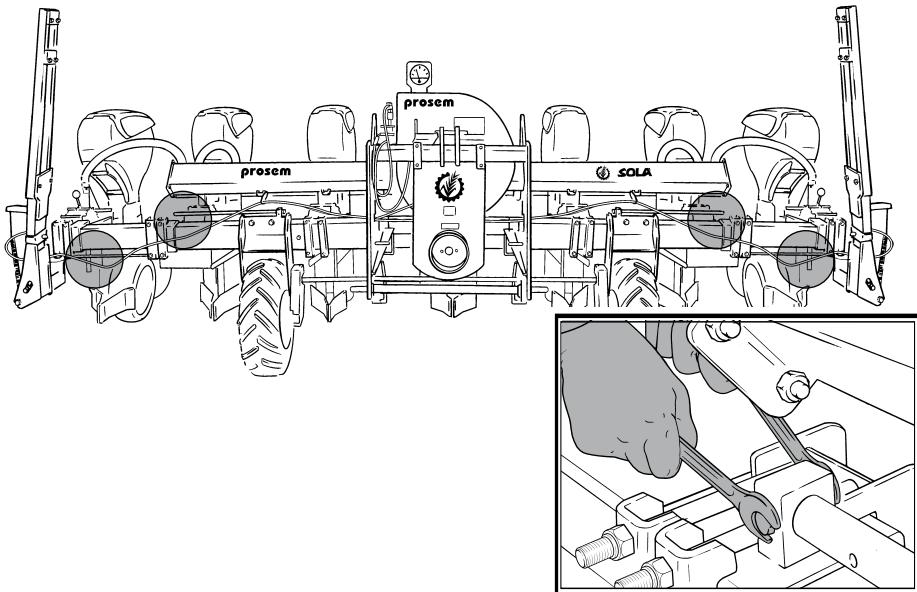

### 6.9.2 TELESCOPIC MACHINES

Telescopic machines only allow some distance measures between rows. In the following table we find possible measures with the standard machine.

FRAME COMPATIBILITY / ROWS NUMBER / ROWS DISTANCE		
<b>MACHINE MODEL</b>	<i>Distance between rows(cm) in reference with the rows number</i>	
	6 filas	7 filas
TELESCOPIC 250S/6	70-75	
TELESCOPIC 300/6	70-75-80	
TELESCOPIC 300S/7		63-70
TELESCOPIC 330/6	70-75-80	
TELESCOPIC 330/7	70-75-80	55-60
TELESCOPIC 330/7 HIBRID	80	60

**To change the rows distance, we are doing:**

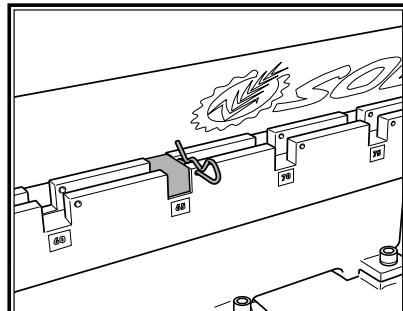

1. Change the fastening point of the central rows ( 3and 4 in 6 rows models, 3,4 and 5 in 7 rows models).
2. Adjust 4 opening snug of the lateral rows.

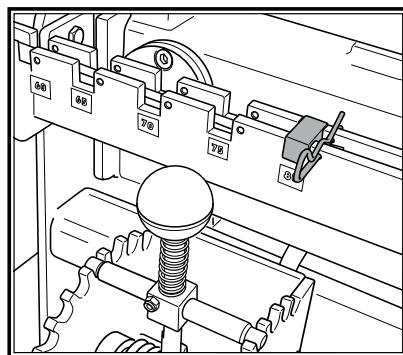

### 6.9.3 VARIANT MACHINES

Variant machines allow change the distance between sowing rows with a simple and fast operation.

The row distance changement is made by moving the snugs.

*General snugs of machine folding*

*Opening snugs between rows*

In the following table you can find the possible measures with standard machine.

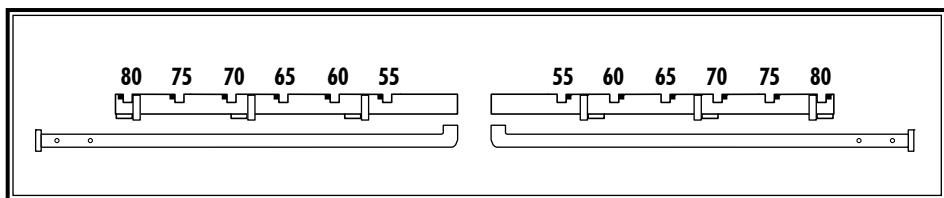

<b>MACHINE MODEL</b>	FRAME COMPATIBILITY / ROWS NUMBER / ROWS DISTANCE				
	4 rows	6 rows	7 rows	8 rows	9 rows
VARIANT 300/6 45-75		45-50-55-60-65-70-75			
VARIANT 300/6 50-80		50-55-60-65-70-75-80			
VARIANT 300/6 50-75 4F95	95	50-55-60-65-70-75			
VARIANT 300/7 45-60 6F75-80		75-80	45-50-55-60		
VARIANT 300/7 50-80 DCH			50-55-60-65-70-75-80		
VARIANT 300/8 45-75				45-50-55-60-65-70-75	
VARIANT 330/8 43-80				43-50-55-60-65-70-75-80	
VARIANT 330/9 40-60					40-45-50-55-60

**MODELO VARIANT 300/6 45-75**

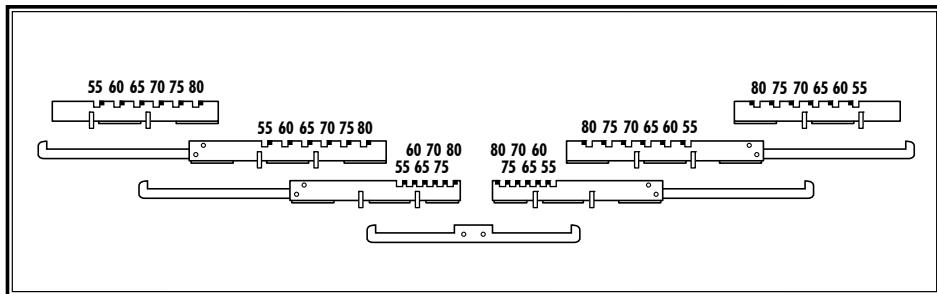

When la machine is folding, rows distance is from 45 cm. Adjusting unfolding snugs we can open the machine to the distance between the following rows: 50, 55, 60, 65, 70, 75. Machine must be completely folding to adjust to avoid serious damages.

**To adjust folding snugs:**

1. Adjust the 2 general snugs of machine folding.

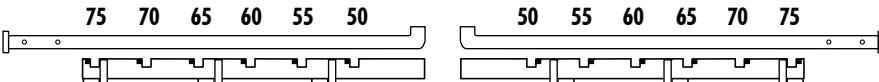

2. Adjust the 6 opening snugs between rows.

**MODELO VARIANT 300/6 50-80**

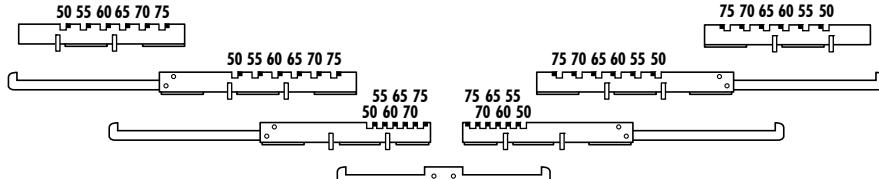

In this model, when the machine is folding, the rows distance is from 50 cm. Adjusting the snups folding we can open the machine to the distance between the following rows: 60, 65, 70, 75, 80. The machine must be completely folding to adjust to avoid serious damages.

**To adjust folding snugs:**

1. Adjust the 2 general opening snugs.

2. Adjust the 6 opening snugs between rows.

**MODEL VARIANT 300 7F45-60 6F75-80**

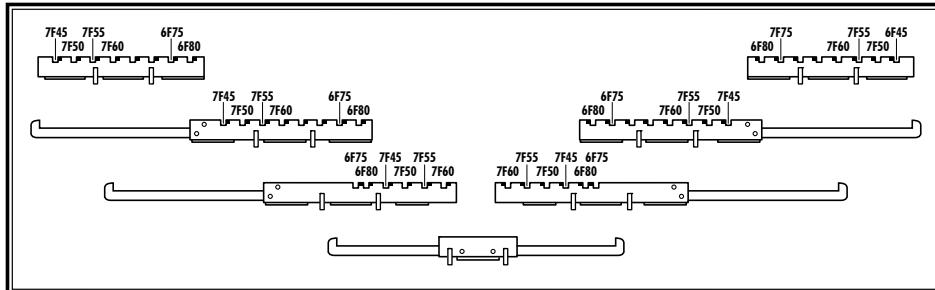

This model allows to sow with 7 rows to 45, 50, 55 and 60 cm between rows. Also we can sow with 6 rows to 75 and 80 cm between rows excluding the central row (see point ....). For doing the adjustment the machine must be completely folding to adjust to avoid serious damages.

**To adjust opening snugs:**

1. Adjust the 2 general opening snugs.

2. Adjust the 6 opening snugs between rows.

### MODEL VARIANT 300 6F50-75 4F95

This model allows to sow with 6 rows to 50, 55, 60, 65, 70 and 75 cm between rows. It allows to sow with 2 distance combination between not equidistant rows (combination "A" and "B"):

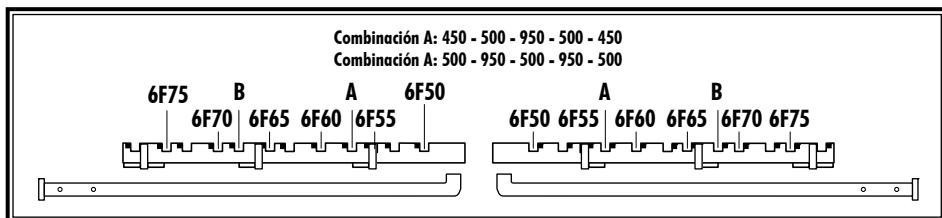

- Combination "A" (distances between rows in cm): 45 – 50 – 95 – 50 – 45
- Combination "B" (distances between rows in cm): 50 – 95 – 50 – 95 – 50

We can sow with 4 rows to 95 cm between rows excluding the rows 2 and 5 (see point...) and placing the snugs in the chosen position with the letter "A".

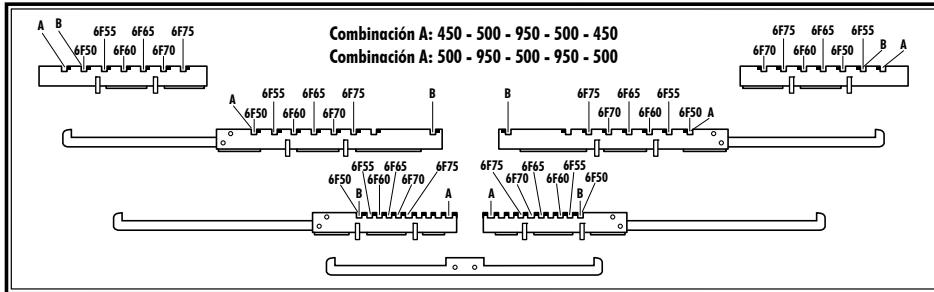

For doing the adjustment the machine must be completely folding to adjust to avoid serious damages.

#### To adjust opening snugs:

1. Adjust the 2 general opening snugs

2. Adjust the 6 opening snugs between rows.

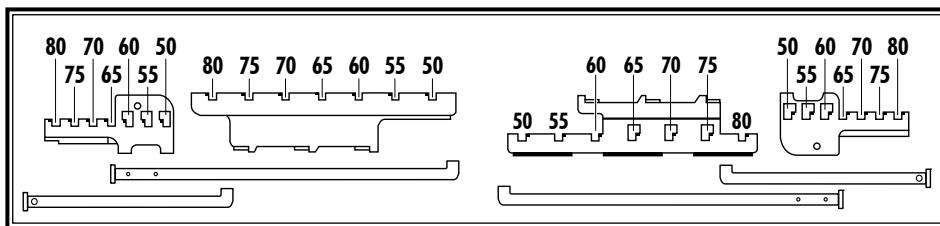

### MODELO VARIANT 300/7 50-80 DCH

Adjusting opening snugs we can open the machine choosing the distance between following rows: 50, 55, 60, 65, 70, 75 and 80 cm.

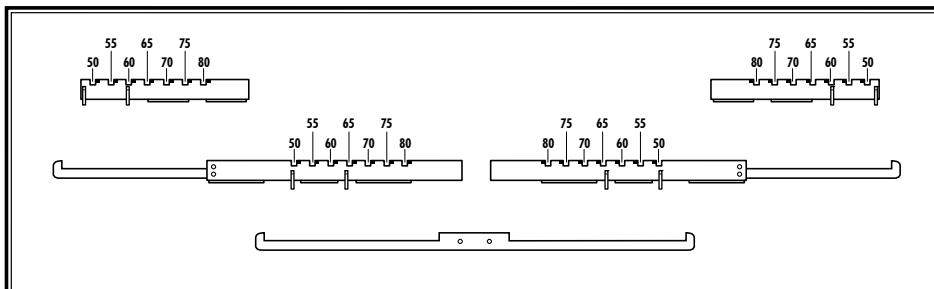

For doing the adjustment the machine must be completely folding to adjust to avoid serious damages.

#### To adjust opening snugs:

1. Adjust the 4 general opening snugs .

2. Adjust the 4 opening snugs between rows.

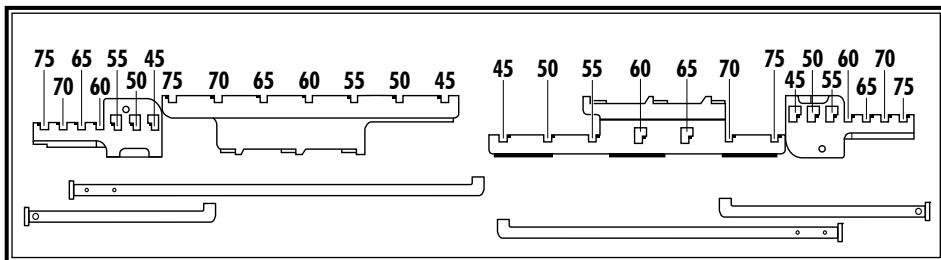

**MODEL VARIANT 300/8 45-75**

Adjusting opening snugs we can open the machine to the distance between the following rows: 45, 50, 55, 60, 65, 70 and 75 cm.

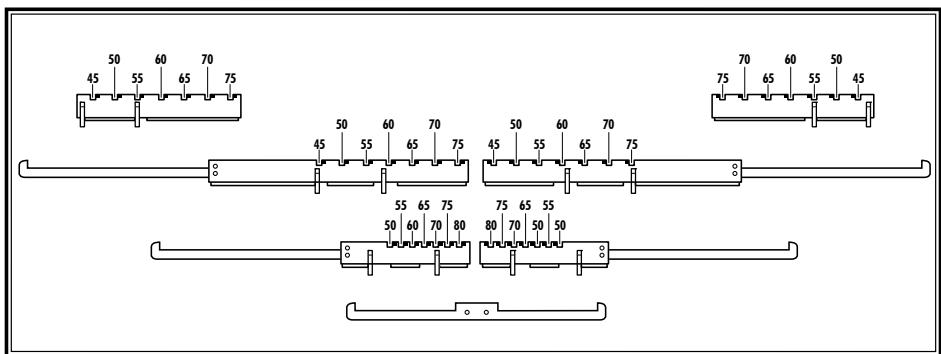

For doing the adjustment the machine must be completely folding to adjust to avoid serious damages.

**To adjust opening snugs:**

1. Adjust the 4 general opening snugs .

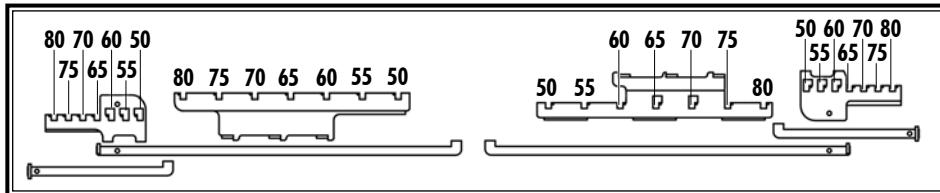

2. Adjust the 4 opening snugs between rows.

**MODELO VARIANT 330/8 43-80**

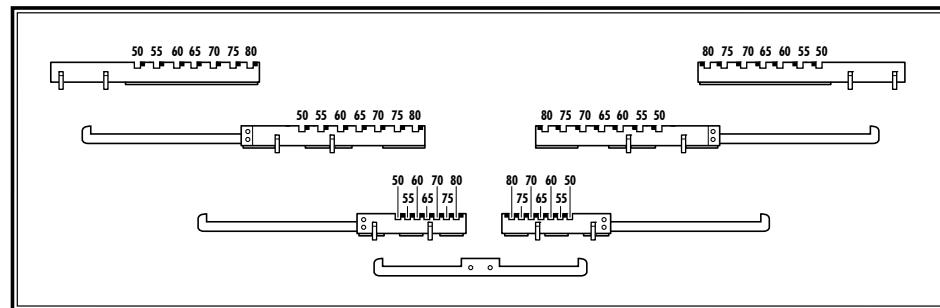

On this model, when the machine is unfolding, distance between rows is 43 cm. Adjusting opening snugs we can open the machine to the following distance between rows: 50, 55, 60, 65, 70, 75 and 80 cm. For doing the adjustment the machine must be completely folding to adjust to avoid serious damages.

**To adjust opening snugs:**

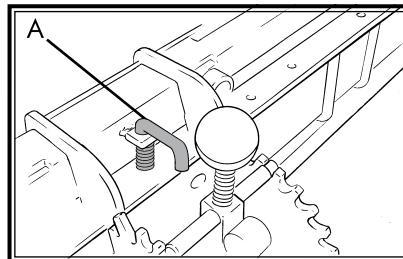

1. Adjust the 4 general opening snugs.

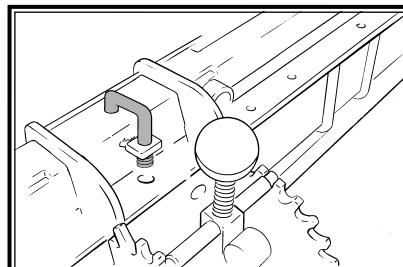

2. Adjust the 4 opening snugs between rows.

**6.9.4. MACHINES VARIANT MANUAL**

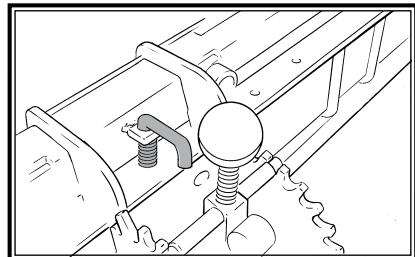

To change the distance between rows, raise the clamp (A).

Place the clamp under the base to make easy the row movement.

For blocking the row, return the clump to the blocking initial position.

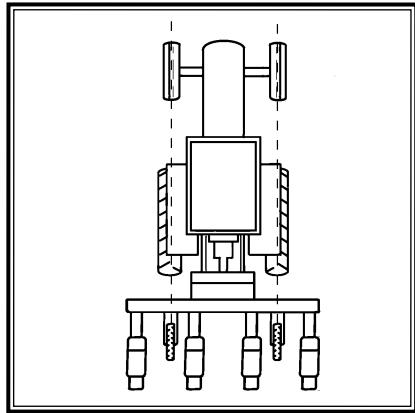

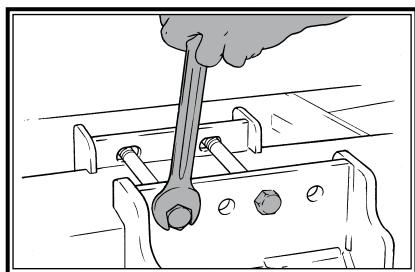

## 6.10 DISTANCE ADJUSTMENT BETWEEN WHEELS

Wheels have to be fit between 2 rows.  
Preferably coinciding with tractor wheels.

Slacken the nut of the screws

Place the wheel in the correct situation.

Fix the nuts of the wheels support.

## 6.11 FERTILIZER ADJUSTMENT

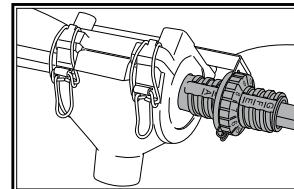

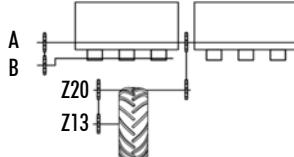

To adjust the fertilizer distribution it is necessary to know the distance between rows, the fertilizer quantity to distribute in each soil hectare and the fertilizer specific weight.

It is very difficult to obtain a very precise regulation due to the fertilizer variety . Density and granulometry are irregular.

To adjust dosage we can find on the following table. The same information is also to sticked on the cover of the fertilizer hopper.

FERTILIZER SPREADER VOLUMETRIC - Quantity distribution table in Kg/Ha																		
<b>A=14Z B=35Z</b>	Distance between the rows																	
	45 cm			50 cm			60 cm			70 cm			75 cm			80 cm		
	Specific weight of the product in kg/dm <sup>3</sup>																	
	0,8	1	1,2	0,8	1	1,2	0,8	1	1,2	0,8	1	1,2	0,8	1	1,2	0,8	1	1,2

Distribution adjustment is placed in each distributor under the hopper. We can adjust the distributor by a wheel turn placed on each distributor side (see photo). The control scale goes from letter A to letter E, having for each letter 10 numbers. It is not advisable adjustments in inferior positions to B/O causing irregular distributions.

Equipment is fit with a double gearing that allow change the distribution transmission. By this way, we can obtain more dosage possibilities. On the table we can find two possible transmissions: A=11Z B=26Z or A=18Z B=18Z.

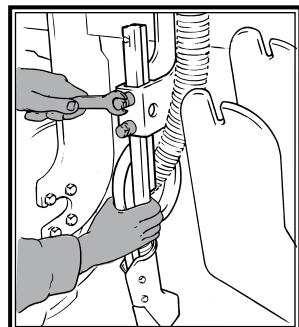

## 6.12 FERTILIZER BOOT ROW ADJUSTMENT

### 6.12.1 FERTILIZER DEPTH CONTROL

Slacken the 2 lock nuts and the 2 screws.

Adjust the boot position of the sowing depth.

Slacken the screws and the lock nuts.

### 6.12.2 ADJUSTMENT OF THE FERTILIZER DOUBLE DISC DEPTH

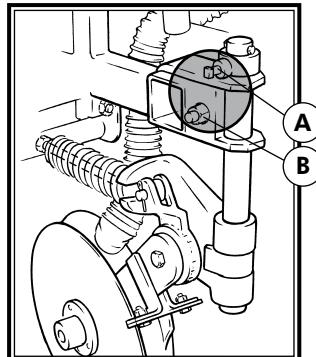

***It can be adjusted by two ways:***

**1: Rod position.**

- Slacken screw s A and B.

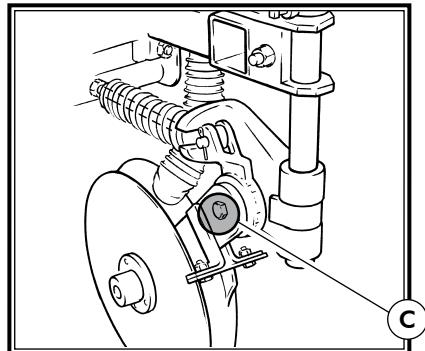

- Place the rod in the correct position.

- Fix the two screws.

**2:** Position of the double disc rod.

- Slacken the screw C.
- Place the correct rod angle.
- Fix the screw.

### 6.12.3 ADJUSTMENT OF THE FERTILIZER ROW LOCATION

Fertilizer rows are fitted in the factory with a distance from 5 to 9 cm between sowing row and fertilizer row.

#### IMPORTANT

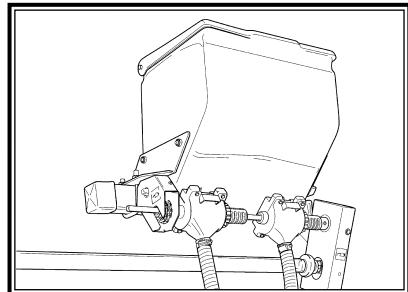

BEFORE TO SOW, BE SURE THE DISTANCES BETWEEN SOWING ROWS AND FERTILIZER ROWS ARE CORRECT, BUT THEY CAN CHANGE DURING TRANSPORT AND STORAGE.

### 6.13 MICROGRANULATOR ADJUSTMENT

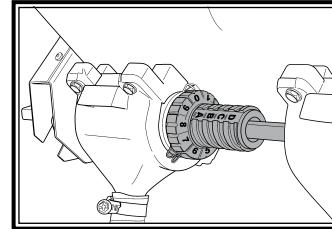

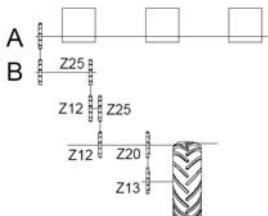

To adjust microgranulator distribution we have to know the distance between rows, product quantity to distribute en each soil hectare and the product specific weight

It is very difficult to obtain a very precise regulation due to the fertilizer variety . Density and granulometry are irregular.

To adjust dosage we can find on the following table. The same information is also to sticked on the cover of the fertilizer hopper.

MICROGRANULATOR - Quantity distribution table in Kg/Ha																				
<b>A=22Z B=12Z</b>		Distance between the rows																		
		45 cm			50 cm			60 cm			70 cm			75 cm			80 cm			
		Specific weight of the product in kg/dm <sup>3</sup>

Distribution adjustment is placed in each distributor under the hopper. We can adjust distributor by a wheel turn placed on each distributor side. (see photo).

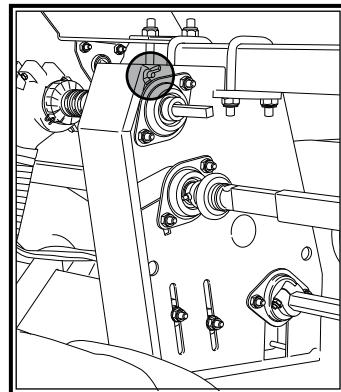

Adjustment scale goes from letter A to letter E, having 10 numbers for each letter. It is not advisable adjustments in inferior positions to B/0 causing irregular distributions.

Equipment is fit with a double gearing that allow change the distribution transmission. By this way, we can obtain more dosage possibilities. On the table we can find two possible transmissions: A=11Z B=26Z or A=18Z B=18Z.

#### **6.13.1 TRANSMISSION CHANGE (A=12Z B=22Z Y A=22Z B=12Z)**

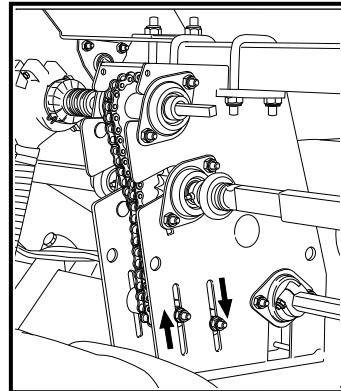

Take away the superior screw of the cover of the transmission box.

Turn the cover downwards.

Slacken the tightener by the keys.

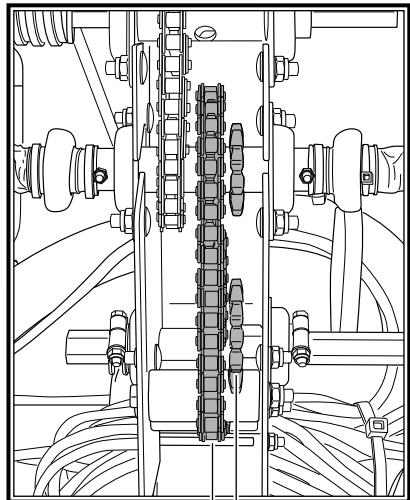

Press the tightener downward to slacken the chain.

Change the chain position.

Draw the chain by 2 tighteners.

To finish, fix the tightener position  
by the fixing nut.

A = Z22

B = Z12

A = Z12

B = Z22

## 7.- MAINTENANCE

### 7.1 SCREWS JOINTS

All screw joints have to be controlled and tighten after first 8 working hours.

### 7.2 WHEELS PRESSURE

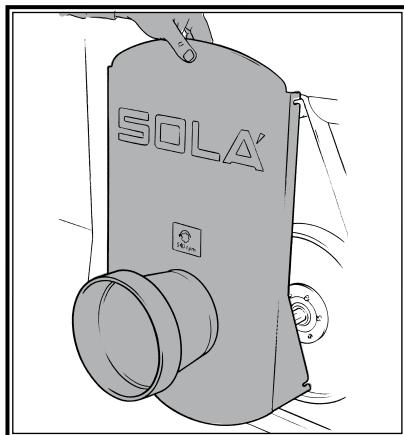

Control the wheel pressure before using the machine.

WHEELS	PRESSURE
5,00 - 15" 4PR	1,5 bar
23x8,50 - 12" 4PR	1,5 bar
23x8,50 - 12" 6PR	2 bar
23x8,50 - 12" 8PR	2,5 bar
23x10,50 - 12" 4PR	1,5 bar
23x10,50 - 12" 8PR	2,5 bar
26x12 - 12" 8PR	2,5 bar

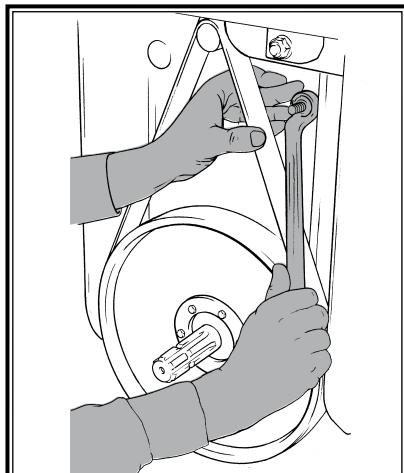

## 7.3 BELT TRANSMISSION ADJUSTMENT

Slacken the 4 cover wing nuts.

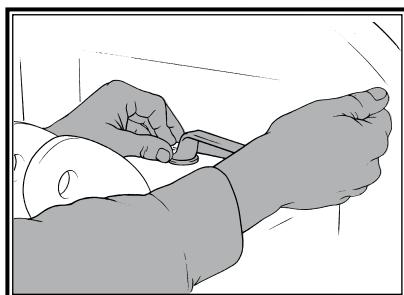

Take out the cover.

Slacken the tightener 4 nuts.

Slacken the transmission belt by a superior screw.

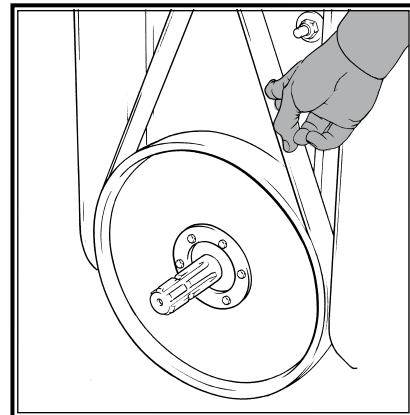

Control the belt streched pressing on the belt.

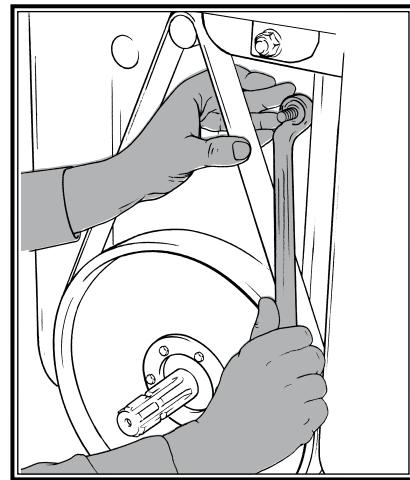

Flexion about 2 mm. aprox.

**WARNING**  
COMPRESSING WITH A CHARGE OF 5 KG. ON THE EQUIDISTANT POINT OF THE PULLEYS AXLES WE CAN CONTROL THE BELT TENSION.

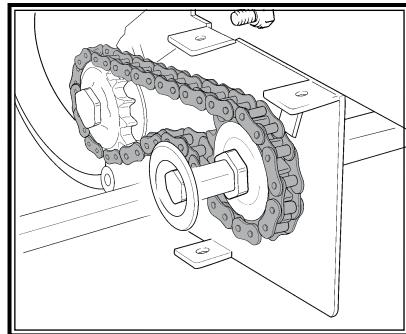

Fix the 4 tightener nuts.

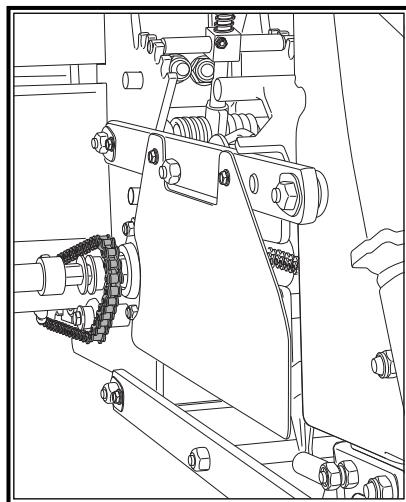

## 7.4 TRANSMISSION CHAINS

For a correct functioning of the chain transmission it is important grease the transmission . The majority of the transmission chains take automatic tighteners with spring and it is not necessary to draw the chain. It exists some chain transmissions with fix tighteners to draw:

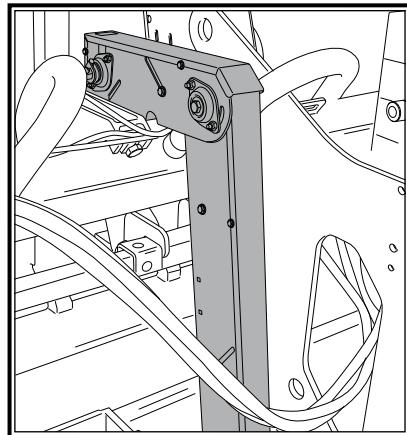

Gearbox central transmission.

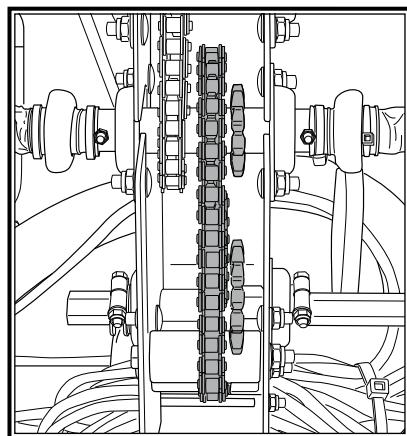

Rows central transmission.

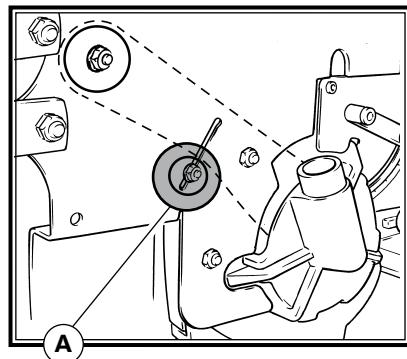

Transmission in "V" micro and fertilizer.

Doble transmission z12-z22 micro.

Prosem P row transmission.

**To draw tighteners:**

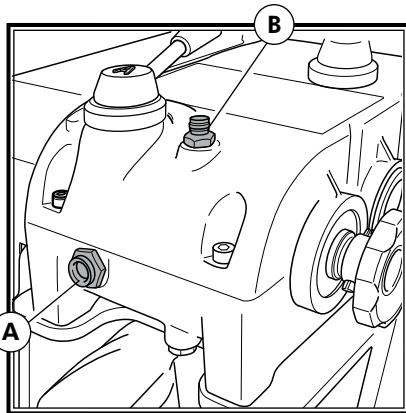

- Take out fixing nuts and take out the covers.
- Slacken the tighteners by two keys.
- Press the tighteners towards the chain to obtain a good draw.

## 7.5 AUTOMATIC GEARBOX

Control oil level by level small window (B).

With a low level in the gearbox, take out the cap (A) and fill in.

Oil changing each 2 years. Use type SAE 30.

## 7.6 CLEAN THE MACHINE

To clean the machine we can use water or a high pressure cleaner.

**ATTENTION**

IN THE CASE TO CLEAN THE HOPPER WITH COMPRESSED AIRE, PAY ATTENTION WITH THE TOXIC POWDERS.

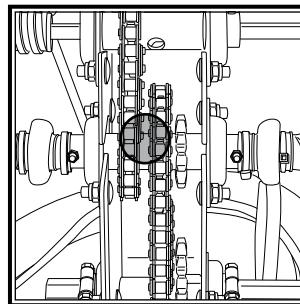

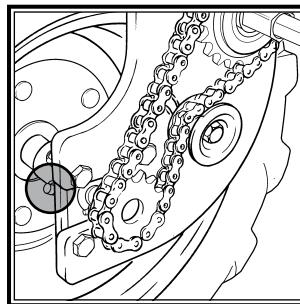

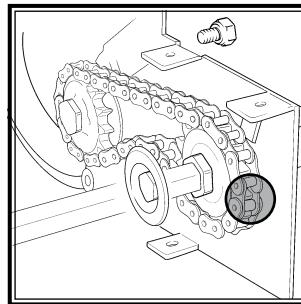

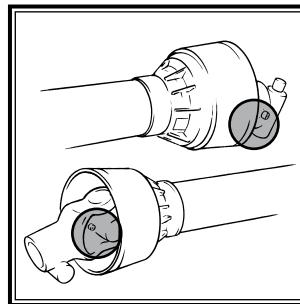

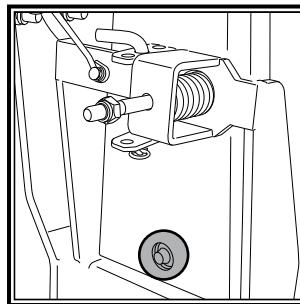

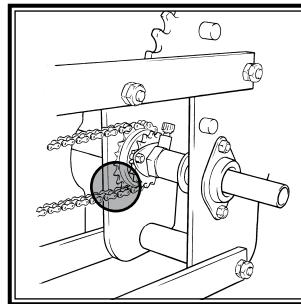

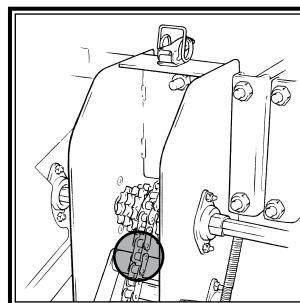

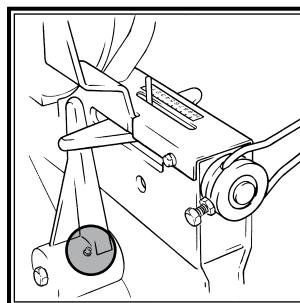

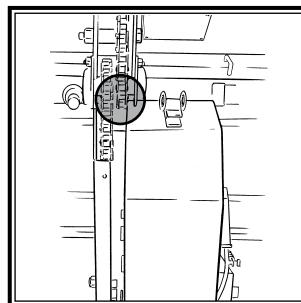

## 7.7 GREASING POINTS

### ATTENTION

GREASE THE ROLLER CHAINS AT THE END OF THE SEASON OR AFTER A LONG PERIOD WITHOUT USE.. FIRST, TAKE OUT THE CHAIN PROTECTORS, GREASE AND PLACE THE PROTECTOR.

THE GREASE POINTS OF THE MACHINE MUST BE GRAISED EACH 50 WORKING HOURS TO AVOID SERIOUS DAMAGES IN THE MACHINE..

## 7.8 MAINTENANCE TABLE

A good maintenance of the machine secure a good working and a long life for the machine.

### ATTENTION

THESE OPERATIONS MUST BE DONE DISCONNECTING THE POWER POINT, STOPPING THE TRACTOR ENGINE AND DISCONNECTING THE KEYSWITCH.

Find on this table the maintenance operations to realise often:

Supervision zone	Operation	Hours			
		8	50	100	500
Machine organs	Grease.		●		
	Slacken machine screws.	●	*		
Fan	Belt adjustment.				●
Wheels	Control presión neumáticos.		●		
Transmisiones de cadena	Transmission chains grease.			●	
	Transmission chains adjustment				●
Chain traditional gearbox	Pinions and chain grease.			●	
Distributor	Transmission chain grease.			●	
	Transmission chain adjustment. (Prosem P).				●
Automatic gearbox	Oil removing.	Each 2 years			

(\*) Realise after first 8 hours of the machine working.
